

UNIT 10A

Concurrency: Moore's Law Revisited & Sorting Networks

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

1

Concurrency

- Concurrency is the process of performing more than one process at a time.
- Computing has many ways to implement concurrency:
 - parallel processing
 - pipelining
 - multitasking
 - distributed computing

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

2

Recall Moore's Law

Microprocessor Transistor Counts 1971-2011 & Moore's Law

3

Clock Speed Is No Longer Increasing

Source: Bob Warfield <http://tinyurl.com/3pt6we9>

- 1 MHz is 1,000,000 cycles/second
- Each cycle is like "step" operation in MARS

15110 Principles of Computing, Carnegie Mellon University - CORTINA

4

Moore's Law

- MARS single pc (program counter) indicates next instruction
- multi-core executing simultaneously at multiple pc 's
- prediction: thousands of cores

Source: Wikimedia Commons <http://tinyurl.com/3d7qf3m>

15110 Principles of Computing, Carnegie Mellon University - CORTINA

2

New Processors are Multi-Cores

15110 Principles of Computing, Carnegie Mellon University - CORTINA

E

Example: Image Processing

Remove Red operation

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

7

Example: Image Processing

```
def remove_red(image)
  num_rows = image.length
  num_columns = image[0].length
  for row in 0..num_rows do
    for column in 0..num_columns do
      image[row][column][0] = 0
    end
  end
  return nil
end
```

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

8

Example: Image Processing

- What order are the pixels processed?
 - row by row, one pixel at a time
- Does this matter?
 - not really: all pixel computations are independent of one another
 - if we have multiple processors (cores), we could have each work on part of the image independently → faster results
 - Graphical Processing Units (GPU)

15110 Principles of Computing, Carnegie Mellon University - CORTINA

9

Example: Sorting Networks

- Comparator
 - Input: A and B
 - Output:
 - If $A \leq B$, then $L = A$ and $H = B$
 - If $A > B$, then $L = B$ and $H = A$

15110 Principles of Computing, Carnegie Mellon University - CORTINA

10

Merge Sort

```
def msort(list)
  return list if list.length == 1
  halfway = list.length/2
  list1 = list[0..halfway-1]
  list2 = list[halfway..list.length-1]
  newlist1 = msort(list1)
  newlist2 = msort(list2)
  newlist = merge(newlist1, newlist2)
  return newlist
end
>> merge([1, 2, 4, 7],[3, 5, 6])
=> [1, 2, 3, 4, 5, 6, 7]
```

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

11

2 X 2 Merge Network

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

12

2 X 2 Merge Network

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

13

2 X 2 Merge Network

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

14

2 X 2 Merge Network

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

15

2 X 2 Merge Network Abstraction

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

16

4 X 4 Odd-Even Merge

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

17

4 X 4 Odd-Even Merge

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

18

n X n Odd-Even Merge

15110 Principles of Computing, Carnegie Mellon University - CORTINA

19

Concurrent Merge Sort using a Sorting Network

time: $O(\log n)$ merges = $O((\log n)^2)$ comparisons

15110 Principles of Computing, Carnegie Mellon University - CORTINA

20

Serial vs. Concurrent Merge Sort

Time Complexity of Merging n Elements:

1. sequential $O(n)$
2. sorting network $O(\log n)$

Time Complexity of Sorting n Elements:

1. sequential: $O(n \log n)$
2. sorting network: $O((\log n)^2)$

Space / Silicon complexity of Sort:

1. sequential: $O(n)$ words of memory
2. sorting network: $O(n(\log n)^2)$ comparison elements

15110 Principles of Computing, Carnegie
Mellon University - CORTINA

21

Summary

- Multi-cores allow us to think about computation as a concurrent process.
- Some applications are naturally “parallel” and can be split up into smaller subproblems that are solved independently by individual processors/cores.
 - image processing
 - sorting
