C Puzzles

- Taken from Exam #2, CS 347, Spring '97
- Assume machine with 32 bit word size, two's complement integers
- For each of the following C expressions, either:
 - Argue that is true for all argument values
 - Give example where not true

Initialization

```
int x = foo();
int y = bar();
unsigned ux = x;
unsigned uy = y;
```

- $x < 0 \Rightarrow ((x*2) < 0)$
- $ux \geq 0$
- $x \& 7 == 7 \Rightarrow (x < 30) < 0$
- $ux > -1$
- $x > y \Rightarrow -x < -y$
- $x * x \geq 0$
- $x > 0 \&\& y > 0 \Rightarrow x + y > 0$
- $x \geq 0 \Rightarrow -x \leq 0$
- $x \leq 0 \Rightarrow -x \geq 0$

Casting Signed to Unsigned

C Allows Conversions from Signed to Unsigned

```
short int      x = 15213;
unsigned short int ux = (unsigned short) x;
short int      y = -15213;
unsigned short int uy = (unsigned short) y;
```

Resulting Value

- No change in bit representation
- Nonnegative values unchanged
– $ux = 15213$
- Negative values change into (large) positive values
– $uy = 50323$

Relation Between 2's Comp. & Unsigned

$$uy = y + 2 * 32768 = y + 65536$$

Signed vs. Unsigned in C

Constants

- By default are considered to be signed integers
- Unsigned if have "U" as suffix
0U, 4294967295U

Casting

- Explicit casting between signed & unsigned same as U2T and T2U

```
int tx, ty;
unsigned ux, uy;
tx = (int) ux;
uy = (unsigned) ty;
```
- Implicit casting also occurs via assignments and procedure calls

```
tx = ux;
uy = ty;
```

Casting Surprises

Expression Evaluation

- If mix unsigned and signed in single expression, signed values implicitly cast to unsigned
- Including comparison operations $<$, $>$, $==$, $<=$, $>=$
- Examples for $W = 32$

Constant ₁	Constant ₂	Relation	Evaluation
0	0U		
-1	0		
-1	0U		
2147483647	-2147483648		
2147483647U	-2147483648		
-1	-2		
(unsigned) -1	-2		
2147483647	2147483648U		
2147483647	(int) 2147483648U		

Explanation of Casting Surprises

2's Comp. → Unsigned

- Ordering Inversion
- Negative → Big Positive

Sign Extension

Task:

- Given w -bit signed integer x
- Convert it to $w+k$ -bit integer with same value

Rule:

- Make k copies of sign bit:
- $X' = \underbrace{X_{w-1}, \dots, X_{w-1}}_{k \text{ copies of MSB}}, X_{w-1}, X_{w-2}, \dots, X_0$

class03.ppt

- 14 -

CS 213 F'01

Sign Extension Example

```
short int x = 15213;
int      ix = (int) x;
short int y = -15213;
int      iy = (int) y;
```

	Decimal	Hex	Binary
x	15213	3B 6D	001111011 01101101
ix	15213	00 00 C4 92	00000000 00000000 001111011 01101101
y	-15213	C4 93	11000100 10010011
iy	-15213	FF FF C4 93	11111111 11111111 11000100 10010011

- Converting from smaller to larger integer data type
- C automatically performs sign extension

class03.ppt

- 15 -

CS 213 F'01

Justification For Sign Extension

Prove Correctness by Induction on k

- Induction Step: extending by single bit maintains value

- Key observation: $-2^{w-1} = -2^w + 2^{w-1}$
- Look at weight of upper bits:

$$\begin{aligned}
 X &= -2^{w-1} X_{w-1} \\
 X' &= -2^w X_{w-1} + 2^{w-1} X_{w-1} = -2^{w-1} X_{w-1}
 \end{aligned}$$

CS 213 F'01

Why Should I Use Unsigned?

Don't Use Just Because Number Nonzero

- C compilers on some machines generate less efficient code

```
unsigned i;
for (i = 1; i < cnt; i++)
    a[i] += a[i-1];
```
- Easy to make mistakes

```
for (i = cnt-2; i >= 0; i--)
    a[i] += a[i+1];
```

Do Use When Performing Modular Arithmetic

- Multiprecision arithmetic
- Other esoteric stuff

Do Use When Need Extra Bit's Worth of Range

- Working right up to limit of word size

Negating with Complement & Increment

In C

$$\sim x + 1 == -x$$

Complement

- Observation: $\sim x + x == 1111\dots11_2 == -1$

$$\begin{array}{r} x \quad 10011101 \\ + \sim x \quad 01100010 \\ \hline -1 \quad 11111111 \end{array}$$

Increment

$$\begin{array}{lcl} \sim x + \cancel{x} + (-\cancel{x} + 1) & == & \cancel{x} + (-x + \cancel{x}) \\ \sim x + 1 & == & -x \end{array}$$

Warning: Be cautious treating int's as integers

Operands: w bits

$$\begin{array}{r} u \quad \boxed{} \boxed{} \boxed{} \boxed{} \boxed{} \boxed{} \\ + v \quad \boxed{} \boxed{} \boxed{} \boxed{} \boxed{} \boxed{} \\ \hline \end{array}$$

True Sum: w+1 bits

Discard Carry: w bits

$UAdd_w(u, v)$

$$\boxed{} \boxed{} \boxed{} \boxed{} \boxed{} \boxed{}$$

Standard Addition Function

- Ignores carry output

Implements Modular Arithmetic

$$s = UAdd_w(u, v) = u + v \bmod 2^w$$

$$UAdd_w(u, v) = \begin{cases} u + v & u + v < 2^w \\ u + v - 2^w & u + v \geq 2^w \end{cases}$$

Visualizing Integer Addition

Integer Addition

- 4-bit integers u and v
- Compute true sum $\text{Add}_4(u, v)$
- Values increase linearly with u and v
- Forms planar surface

Visualizing Unsigned Addition

Wraps Around

- If true sum $\geq 2^w$
- At most once

Mathematical Properties

Modular Addition Forms an Abelian Group

- **Closed under addition**
 $0 \leq \text{UAdd}_w(u, v) \leq 2^w - 1$
- **Commutative**
 $\text{UAdd}_w(u, v) = \text{UAdd}_w(v, u)$
- **Associative**
 $\text{UAdd}_w(t, \text{UAdd}_w(u, v)) = \text{UAdd}_w(\text{UAdd}_w(t, u), v)$
- **0 is additive identity**
 $\text{UAdd}_w(u, 0) = u$
- **Every element has additive inverse**
 - Let $\text{UComp}_w(u) = 2^w - u$
 $\text{UAdd}_w(u, \text{UComp}_w(u)) = 0$

Two's Complement Addition

Operands: w bits

True Sum: $w+1$ bits

Discard Carry: w bits

TAdd and UAdd have Identical Bit-Level Behavior

- Signed vs. unsigned addition in C:

```
int s, t, u, v;
s = (int) ((unsigned) u + (unsigned) v);
t = u + v;
```
- Will give $s == t$

Characterizing TAdd

Functionality

- True sum requires $w+1$ bits
- Drop off MSB
- Treat remaining bits as 2's comp. integer

$$TAdd_w(u, v) = \begin{cases} u + v + 2^{w-1} & u + v < TMin_w \text{ (NegOver)} \\ u + v & TMin_w \leq u + v \leq TMax_w \\ u + v - 2^{w-1} & TMax_w < u + v \text{ (PosOver)} \end{cases}$$

Visualizing 2's Comp. Addition

Values

- 4-bit two's comp.
- Range from -8 to +7

Wraps Around

- If $\text{sum} \geq 2^{w-1}$
 - Becomes negative
 - At most once
- If $\text{sum} < -2^{w-1}$
 - Becomes positive
 - At most once

Detecting 2's Comp. Overflow

Task

- Given $s = TAdd_w(u, v)$
- Determine if $s = Add_w(u, v)$
- Example

```
int s, u, v;
s = u + v;
```

Claim

- Overflow iff either:
 - $u, v < 0, s \geq 0$ (NegOver)
 - $u, v \geq 0, s < 0$ (PosOver)
- `ovf = (u < 0 == v < 0) && (u < 0 != s < 0);`

Mathematical Properties of TAdd

Isomorphic Algebra to UAdd

- $TAdd_w(u, v) = U2T(UAdd_w(T2U(u), T2U(v)))$
 - Since both have identical bit patterns

Two's Complement Under TAdd Forms a Group

- Closed, Commutative, Associative, 0 is additive identity
- Every element has additive inverse

Let $TComp_w(u) = U2T(UComp_w(T2U(u)))$
 $TAdd_w(u, TComp_w(u)) = 0$

$$TComp_w(u) = \begin{cases} -u & u \neq TMin_w \\ \boxed{} & u = TMin_w \end{cases}$$

Negating with Complement & Increment

In C

$$\sim x + 1 == -x$$

Complement

- Observation: $\sim x + x == 1111\dots11_2 == -1$

$$\begin{array}{r} x \quad 10011101 \\ + \sim x \quad 01100010 \\ \hline -1 \quad 11111111 \end{array}$$

Increment

- $\sim x + \cancel{x} + (-\cancel{x} + 1) == \cancel{-1} + (-x + \cancel{1})$
- $\sim x + 1 == -x$

Warning: Be cautious treating int's as integers

- OK here: We are using group properties of TAdd and TComp

Multiplication

Computing Exact Product of w -bit numbers x, y

- Either signed or unsigned

Ranges

- **Unsigned:** $0 \leq x * y \leq (2^w - 1)^2 = 2^{2w} - 2^{w+1} + 1$
– Up to $2w$ bits
- **Two's complement min:** $x * y \geq (-2^{w-1}) * (-2^{w-1} - 1) = -2^{2w-2} + 2^{w-1}$
– Up to $2w-1$ bits
- **Two's complement max:** $x * y \leq (2^{w-1} - 1)^2 = 2^{2w-2} - 2^{w-1} + 1$
– Up to $2w$ bits, but only for $TMin_w^2$

Maintaining Exact Results

- Would need to keep expanding word size with each product computed
- Done in software by “arbitrary precision” arithmetic packages
- Also implemented in Lisp, and other “advanced” languages

Unsigned Multiplication in C

CS 213 F'01

Unsigned vs. Signed Multiplication

Unsigned Multiplication

```
unsigned ux = (unsigned) x;
unsigned uy = (unsigned) y;
unsigned up = ux * uy;
```

- Truncates product to w -bit number $up = UMult_w(ux, uy)$
- Simply modular arithmetic
 $up = ux \cdot uy \bmod 2^w$

Two's Complement Multiplication

```
int x, y;
int p = x * y;
```

- Compute exact product of two w -bit numbers x, y
- Truncate result to w -bit number $p = TMult_w(x, y)$

Relation

- Signed multiplication gives same bit-level result as unsigned
- $up == (unsigned) p$

 $\text{UMult}_w(t, \text{UAdd}_w(u, v)) = \text{UAdd}_w(\text{UMult}_w(t, u), \text{UMult}_w(t, v))$

Properties of Two's Comp. Arithmetic

Isomorphic Algebras

- Unsigned multiplication and addition
 - Truncating to w bits
- Two's complement multiplication and addition
 - Truncating to w bits

Both Form Rings

- Isomorphic to ring of integers mod 2^w

Comparison to Integer Arithmetic

- Both are rings
- Integers obey ordering properties, e.g.,
 $u > 0 \Rightarrow u + v > v$
 $u > 0, v > 0 \Rightarrow u \cdot v > 0$
- These properties are not obeyed by two's complement arithmetic
 $TMax + 1 == TMin$
 $15213 * 30426 == -10030$ (16-bit words)

C Puzzle Answers

- Assume machine with 32 bit word size, two's complement integers
- $TMin$ makes a good counterexample in many cases

- $x < 0 \Rightarrow ((x * 2) < 0)$
- $ux \geq 0$
- $x \& 7 == 7 \Rightarrow (x \ll 30) < 0$
- $ux > -1$
- $x > y \Rightarrow -x < -y$
- $x * x \geq 0$
- $x > 0 \&\& y > 0 \Rightarrow x + y > 0$
- $x \geq 0 \Rightarrow -x \leq 0$
- $x \leq 0 \Rightarrow -x \geq 0$
