Proxy
Web & Concurrency

Ian Hartwig
15/18-213 - Section E
Recitation 13
April 15th, 2013
Outline

- Getting content on the web: Telnet/cURL Demo
- How the web really works
- Proxy
  - Due Tuesday, Dec. 3rd
  - You can use your late days this year
  - No partners this year
- Threading
  - Semaphores & Mutexes
  - Readers-Writer Lock
The Web in a Textbook

- Client request page, server provides, transaction done.

- A sequential server can handle this. We just need to serve one page at a time.

- This works great for simple text pages with embedded styles.
Telnet/Curl Demo

- **Telnet**
  - Interactive remote shell – like ssh without security
  - Must build HTTP request manually
    - This can be useful if you want to test response to malformed headers

[03:30] [ihartwig@lemonshark:proxylab-handout-f13]% telnet www.cmu.edu 80
Trying 128.2.42.52...
Connected to WWW-CMU-PROD-VIP.ANDREW.cmu.edu (128.2.42.52).
Escape character is '^]'.
GET http://www.cmu.edu/ HTTP/1.0

HTTP/1.1 301 Moved Permanently
Date: Sun, 17 Nov 2013 08:31:10 GMT
Server: Apache/1.3.42 (Unix) mod_gzip/1.3.26.1a mod_pubcookie/3.3.4a mod_ssl/2.8.31 OpenSSL/0.9.8e-fips-rhel5
Location: http://www.cmu.edu/
Connection: close
Content-Type: text/html; charset=iso-8859-1

<!DOCTYPE HTML PUBLIC "-//IETF//DTD HTML 2.0//EN">
<html>
<head>
<title>301 Moved Permanently</title>
</head>
<body>
<h1>Moved Permanently</h1>
The document has moved <a href="http://www.cmu.edu/index.shtml">here</a>.<p>
</body></html>

Connection closed by foreign host.
Telnet/cURL Demo

- cURL
  - “URL transfer library” with a command line program
  - Builds valid HTTP requests for you!

  [03:28] [ihartwig@lemonshark:proxylab-handout-f13]% curl http://www.cmu.edu/
  <!DOCTYPE HTML PUBLIC "-//IETF//DTD HTML 2.0//EN">
  <HTML><HEAD>
  <TITLE>301 Moved Permanently</TITLE>
  </HEAD><BODY>
  <H1>Moved Permanently</H1>
  The document has moved <A HREF="http://www.cmu.edu/index.shtml">here</A>.<P>
  <HR>
  <ADDRESS>Apache/1.3.42 Server at <A HREF="mailto:webmaster@andrew.cmu.edu">www.cmu.edu</A> Port 80</ADDRESS>
  </BODY></HTML>

- Can also be used to generate HTTP proxy requests:

  [03:40] [ihartwig@lemonshark:proxylab-conc]% curl --proxy lemonshark.ics.cs.cmu.edu:3092 http://www.cmu.edu/
  <!DOCTYPE HTML PUBLIC "-//IETF//DTD HTML 2.0//EN">
  <HTML><HEAD>
  <TITLE>301 Moved Permanently</TITLE>
  </HEAD><BODY>
  <H1>Moved Permanently</H1>
  The document has moved <A HREF="http://www.cmu.edu/index.shtml">here</A>.<P>
  <HR>
  <ADDRESS>Apache/1.3.42 Server at <A HREF="mailto:webmaster@andrew.cmu.edu">www.cmu.edu</A> Port 80</ADDRESS>
  </BODY></HTML>
How the Web Really Works

- In reality, a single HTML page today may depend on 10s or 100s of support files (images, stylesheets, scripts, etc.)
- Builds a good argument for concurrent servers
  - Just to load a single modern webpage, the client would have to wait for 10s of back-to-back request
  - I/O is likely slower than processing, so back
- Caching is simpler if done in pieces rather than whole page
  - If only part of the page changes, no need to fetch old parts again
  - Each object (image, stylesheet, script) already has a unique URL that can be used as a key
How the Web Really Works

■ Excerpt from www.cmu.edu/index.html:

<html lang="en" xml:lang="en" xmlns="http://www.w3.org/1999/xhtml">
<head>

... 
<link href="homecss/cmu.css" rel="stylesheet" type="text/css"/>
<link href="homecss/cmu-new.css" rel="stylesheet" type="text/css"/>
<link href="homecss/cmu-new-print.css" media="print" rel="stylesheet" type="text/css"/>
<link href="http://www.cmu.edu/RSS/stories.rss" rel="alternate" title="Carnegie Mellon Homepage Stories" type="application/rss+xml"/>

... 
<script language="JavaScript" src="js/dojo.js" type="text/javascript"></script>
<script language="JavaScript" src="js/scripts.js" type="text/javascript"></script>
<script language="javascript" src="js/jquery.js" type="text/javascript"></script>
<script language="javascript" src="js/homepage.js" type="text/javascript"></script>
<script language="javascript" src="js/app_ad.js" type="text/javascript"></script>

Aside: Setting up Firefox to use a proxy

- You may use any browser, but we’ll be grading with Firefox
- Preferences > Advanced > Network > Settings... (under Connection)
- Check “Use this proxy for all protocols” or your proxy will appear to work for HTTPS traffic.
Sequential Proxy
Sequential Proxy

- **Note the sloped shape of when requests finish**
  - Although many requests are made at once, the proxy does not accept a new job until it finishes the current one
  - Requests are made in batches. This results from how HTML is structured as files that reference other files.

- **Compared to the concurrent example (next), this page takes a long time to load with just static content**
Concurrent Proxy
Concurrent Proxy

- Now, we see much less purple (waiting), and less time spent overall.
- Notice how multiple green (receiving) blocks overlap in time
  - Our proxy has multiple connections open to the browser to handle several tasks at once
How the Web Really Works

- A note on AJAX (and XMLHttpRequests)
  - Normally, a browser will make the initial page request then request any supporting files
  - And XMLHttpRequest is simply a request from the page once it has been loaded & the scripts are running
  - The distinction does not matter on the server side – everything is an HTTP Request
Proxy - Functionality

- **Should work on vast majority of sites**
  - Reddit, Vimeo, CNN, YouTube, NY Times, etc.
  - Some features of sites which require the POST operation (sending data to the website), will not work
    - Logging in to websites, sending Facebook message
  - HTTPS is not expected to work
    - Google (and some other popular websites) now try to push users to HTTPS by default; watch out for that

- **Cache previous requests**
  - Use LRU eviction policy
  - Must allow for concurrent reads while maintaining consistency
  - Details in write up
Proxy - Functionality

- Why a multi-threaded cache?
  - Sequential cache would bottleneck parallel proxy
  - Multiple threads can read cached content safely
    - Search cache for the right data and return it
    - Two threads can read from the same cache block
  - But what about writing content?
    - Overwrite block while another thread reading?
    - Two threads writing to same cache block?
Proxy - How

Client

socket

bind

listen

accept

rio_readlineb

rio_writen

rio_readlineb

rio_writen

close

EOF

Server

socket

open_listenfd

Client / Server Session

open_clientfd

connect

accept

rio_readlineb

rio_writen

close

EOF
Proxy - How

■ Remember that picture?
  ▪ Proxies are a bit special; they are a server and a client at the same time.
  ▪ They take a request from one computer (acting as the server), and make it on their behalf (as the client).
  ▪ Ultimately, the control flow of your program will look like a server, but will have to act as a client to complete the request

■ Start small
  ▪ Grab yourself a copy of the echo server (pg. 910) and client (pg. 909) in the book
  ▪ Also review the tiny.c basic web server code to see how to deal with HTTP headers
    ▪ Note that tiny.c ignores these; you may not
Proxy - How

- What you end up with will resemble:

- **Client socket address**: 128.2.194.242:51213
- **Server socket address**: 208.216.181.15:80
- **Proxy server socket address**: 128.2.194.34:15213
- **Proxy client socket address**: 128.2.194.34:52943
Proxy – Testing & Grading

- **New: Autograder**
  - `./driver.sh` will run the same tests as `autolab`:
    - Ability to pull basic web pages from a server
    - Handle a (concurrent) request while another request is still pending
    - Fetch a web page again from your cache after the server has been stopped
  - This should help answer the question “is this what my proxy is supposed to do?”
  - Please don’t use this grader to definitively test your proxy; there are many things not tested here
Proxy – Testing & Grading

■ Test your proxy liberally
  - The web is full of special cases that want to break your proxy
  - Generate a port for yourself with ./port-for-user.pl [andrewid]
  - Generate more ports for web servers and such with ./free-port.sh
  - Consider using your andrew web space (~/www) to host test files
    - You have to visit
      https://www.andrew.cmu.edu/server/publish.html to publish your folder to the public server

■ Create a handin file with make handin
  - Will create a tar file for you with the contents of your proxylab-handin folder
Tips: Version Control

■ What is Git?
  ▪ Version control software
  ▪ Easily roll back to previous version if needed
  ▪ Already installed on Andrew machines
  ▪ Set up a repo on GitHub, BitBucket, or AFS
    – Make sure only can access it!

■ Using Git
  ▪ git pull
  ▪ git add .
  ▪ git commit -m “I changed something”
  ▪ git push
Mutexes & Semaphores

- **Mutexes**
  - Allow only one thread to run code section at a time
  - If other threads are trying to run the code, they will wait

- **Semaphores**
  - Allows a fixed number of threads to run the code
  - Mutexes are a special case of semaphores, where the number of threads=1
    - Examples will be done with semaphores to illustrate
Read-Write Lock

- Also called a Readers-Writer lock in the notes
- Cache can be read in parallel safely
- If thread is writing, no other thread can read or write
- If thread is reading, no other thread can write
- Potential issues
  - Writing starvation
    - If threads always reading, no thread can write
    - Fix: if a thread is waiting to write, it gets priority over any new threads trying to read

- How can we lock out threads?
Read-Write Locks Cont.

- How would you make a read-write lock with semaphores?
  - Luckily, you don't have to!
    - pthread_rwlock_* handles that for you
      - pthread_rwlock_t lock;
      - pthread_rwlock_init(&lock,NULL);
      - pthread_rwlock_rdlock(&lock);
      - pthread_rwlock_wrlock(&lock);
      - pthread_rwlock_unlock(&lock);
Questions?
