

15-213

“The course that gives CMU its Zip!”

Integer Arithmetic Operations

Sept. 3, 1998

Topics

- **Basic operations**
 - Addition, negation, multiplication
- **Programming Implications**
 - Consequences of overflow
 - Using shifts to perform power-of-2 multiply/divide

C Puzzles

- Taken from Exam #2, CS 347, Spring '97
- Assume machine with 32 bit word size, two's complement integers
- For each of the following C expressions, either:
 - Argue that is true for all argument values
 - Give example where not true

Initialization

```
int x = foo();
int y = bar();
unsigned ux = x;
unsigned uy = y;
```

- $x < 0$ $((x*2) < 0)$
- $ux \geq 0$
- $x \& 7 == 7$ $(x \ll 30) < 0$
- $ux > -1$
- $x > y$ $-x < -y$
- $x * x \geq 0$
- $x > 0 \&\& y > 0$ $x + y > 0$
- $x \geq 0$ $-x \leq 0$
- $x \leq 0$ $-x \geq 0$

Unsigned Addition

Operands: w bits

True Sum: $w+1$ bits

Discard Carry: w bits

$UAdd_w(u, v)$

Standard Addition Function

- Ignores carry output

Implements Modular Arithmetic

$$s = UAdd_w(u, v) = u + v \bmod 2^w$$

$$UAdd_w(u, v) = \begin{cases} u + v & u + v < 2^w \\ u + v - 2^w & u + v \geq 2^w \end{cases}$$

Visualizing Integer Addition

Integer Addition

- 4-bit integers u and v
- Compute true sum $\text{Add}_4(u, v)$
- Values increase linearly with u and v
- Forms planar surface

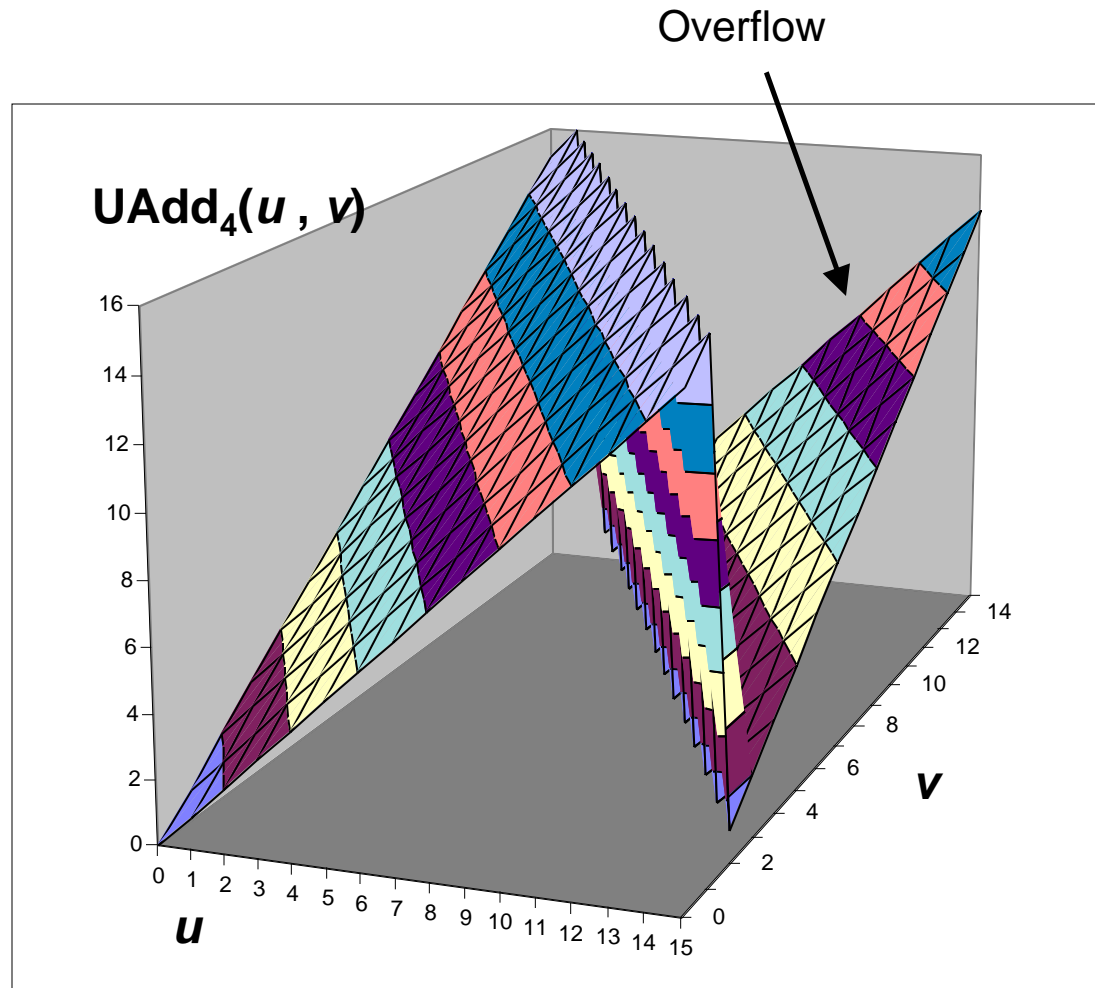

Visualizing Unsigned Addition

Wraps Around

- If true sum $\geq 2^w$
- At most once

True Sum

Mathematical Properties

Modular Addition Forms an *Abelian Group*

- **Closed under addition**

$$0 \leq \text{UAdd}_w(u, v) < 2^w - 1$$

- **Commutative**

$$\text{UAdd}_w(u, v) = \text{UAdd}_w(v, u)$$

- **Associative**

$$\text{UAdd}_w(t, \text{UAdd}_w(u, v)) = \text{UAdd}_w(\text{UAdd}_w(t, u), v)$$

- **0 is additive identity**

$$\text{UAdd}_w(u, 0) = u$$

- **Every element has additive inverse**

– Let $\text{UComp}_w(u) = 2^w - u$

$$\text{UAdd}_w(u, \text{UComp}_w(u)) = 0$$

Detecting Unsigned Overflow

Task

- Given $s = \text{UAdd}_w(u, v)$
- Determine if $s = u + v$

Application

```
unsigned s, u, v;  
s = u + v;
```

- Did addition overflow?

Claim

- Overflow iff $s < u$
 $\text{ovf} = (s < u)$
- Or symmetrically iff $s < v$

Proof

- Know that $0 \leq v < 2^w$
- No overflow $\implies s = u + v \quad u + 0 = u$
- Overflow $\implies s = u + v - 2^w < u + 0 = u$

No Overflow

Overflow

Two's Complement Addition

Operands: w bits

True Sum: $w+1$ bits

Discard Carry: w bits

$\text{TAdd}_w(u, v)$

TAdd and UAdd have Identical Bit-Level Behavior

- Signed vs. unsigned addition in C:

```
int s, t, u, v;
```

```
s = (int) ((unsigned) u + (unsigned) v);
```

```
t = u + v
```

- Will give $s == t$

Characterizing TAdd

Functionality

- True sum requires $w+1$ bits
- Drop off MSB
- Treat remaining bits as 2's comp. integer

$$TAdd_w(u, v) = \begin{matrix} u + v + 2^{w-1} & u + v < TMin_w & \text{(NegOver)} \\ u + v & TMin_w \leq u + v \leq TMax_w & \\ u + v - 2^{w-1} & TMax_w < u + v & \text{(PosOver)} \end{matrix}$$

Visualizing 2's Comp. Addition

Values

- 4-bit two's comp.
- Range from -8 to +7

Wraps Around

- If sum $\geq 2^{w-1}$
 - Becomes negative
 - At most once
- If sum $< -2^{w-1}$
 - Becomes positive
 - At most once

NegOver

Detecting 2's Comp. Overflow

Task

- Given $s = \text{TAdd}_w(u, v)$
- Determine if $s = \text{Add}_w(u, v)$
- Example

```
int s, u, v;  
s = u + v;
```

Claim

- Overflow iff either:
 - $u, v < 0, s \geq 0$ (NegOver)
 - $u, v \geq 0, s < 0$ (PosOver)
- ```
ovf = (u < 0 == v < 0) && (u < 0 != s < 0);
```

## Proof

- Easy to see that if  $u \geq 0$  and  $v < 0$ , then  $\text{TMin}_w(u+v) = \text{TMax}_w(u+v)$
- Symmetrically if  $u < 0$  and  $v \geq 0$
- Other cases from analysis of TAdd

# Mathematical Properties of TAdd

## Isomorphic Algebra to UAdd

- $TAdd_w(u, v) = U2T(UAdd_w(T2U(u), T2U(v)))$ 
  - Since both have identical bit patterns

## Two's Complement Under TAdd Forms a Group

- **Closed, Commutative, Associative, 0 is additive identity**
- **Every element has additive inverse**
  - Let  $TComp_w(u) = U2T(UComp_w(T2U(u)))$
  - $TAdd_w(u, TComp_w(u)) = 0$

$$TComp_w(u) = \begin{matrix} -u & u \\ TMin_w & u = TMin_w \end{matrix}$$

# Two's Complement Negation

## Mostly like Integer Negation

- $TComp(u) = -u$

## *TMin* is Special Case

- $TComp(TMin) = TMin$

## Negation in C is Actually TComp

$$mx = -x$$

- $mx = TComp(x)$
- **Computes additive inverse for TAdd**

$$x + -x == 0$$

# Negating with Complement & Increment

## In C

$$\sim x + 1 == -x$$

## Complement

- Observation:  $\sim x + x == 1111\dots11_2 == -1$

$$\begin{array}{r} x \quad \boxed{1} \boxed{0} \boxed{0} \boxed{1} \boxed{1} \boxed{1} \boxed{0} \boxed{1} \\ + \quad \sim x \quad \boxed{0} \boxed{1} \boxed{1} \boxed{0} \boxed{0} \boxed{0} \boxed{1} \boxed{0} \\ \hline -1 \quad \boxed{1} \boxed{1} \boxed{1} \boxed{1} \boxed{1} \boxed{1} \boxed{1} \boxed{1} \end{array}$$

## Increment

- $\sim x + \cancel{x} + (\cancel{-x} + 1) == \cancel{-1} + (-x + \cancel{1})$
- $\sim x + 1 == -x$

## Warning: Be cautious treating `int`'s as integers

- OK here: We are using group properties of TAdd and TComp

# Comp. & Incr. Examples

x = 15213

|      | Decimal | Hex   | Binary                    |
|------|---------|-------|---------------------------|
| x    | 15213   | 3B 6D | 00111011 01101101         |
| ~x   | -15214  | C4 92 | 11000100 10010010         |

# Comparing Two's Complement Numbers

## Task

- **Given** signed numbers  $u, v$
- Determine whether or not  $u > v$ 
  - Return 1 for numbers in shaded region below

## Bad Approach

- Test  $(u - v) > 0$ 
  - $TSub(u, v) = TAdd(u, TComp(v))$
- Problem: Thrown off by either Negative or Positive Overflow

# Comparing with TSub

## Will Get Wrong Results

- **NegOver:**  $u < 0, v > 0$   
– but  $u - v > 0$
- **PosOver:**  $u > 0, v < 0$   
– but  $u - v < 0$

# Working Around Overflow Problems

## Partition into Three Regions

- $u < 0, v \geq 0 \quad u < v$

- $u \geq 0, v < 0 \quad u > v$

- $u, v$  same sign  $u-v$  does not overflow

– **Can safely use test**  $(u-v) > 0$

# Multiplication

## Computing Exact Product of $w$ -bit numbers $x, y$

- Either signed or unsigned

## Ranges

- **Unsigned:**  $0 \leq x * y \leq (2^w - 1)^2 = 2^{2w} - 2^{w+1} + 1$ 
  - Up to  $2w$  bits
- **Two's complement min:**  $x * y \geq (-2^{w-1}) * (2^{w-1} - 1) = -2^{2w-2} + 2^{w-1}$ 
  - Up to  $2w-1$  bits
- **Two's complement max:**  $x * y \leq (2^{w-1} - 1)^2 = 2^{2w-2} - 2^{w-1} + 1$ 
  - Up to  $2w$  bits, but only for  $TMin_w^2$

## Maintaining Exact Results

- Would need to keep expanding word size with each product computed
- Done in software by “arbitrary precision” arithmetic packages
- Also implemented in Lisp, ML, and other “advanced” languages

# Unsigned Multiplication in C

## Standard Multiplication Function

- Ignores high order  $w$  bits

## Implements Modular Arithmetic

$$\text{UMult}_w(u, v) = u \cdot v \bmod 2^w$$

# Unsigned vs. Signed Multiplication

## Unsigned Multiplication

```
unsigned ux = (unsigned) x;
```

```
unsigned uy = (unsigned) y;
```

```
unsigned up = ux * uy
```

- Truncates product to  $w$ -bit number  $up = \text{UMult}_w(ux, uy)$
- Simply modular arithmetic

$$up = ux \cdot uy \bmod 2^w$$

## Two's Complement Multiplication

```
int x, y;
```

```
int p = x * y;
```

- Compute exact product of two  $w$ -bit numbers  $x, y$
- Truncate result to  $w$ -bit number  $p = \text{TMult}_w(x, y)$

## Relation

- Signed multiplication gives same bit-level result as unsigned
- `up == (unsigned) p`

# Multiplication Examples

```
short int x = 15213;
int txx = ((int) x) * x;
int xx = (int) (x * x);
int xx2 = (int) (2 * x * x);
```

```
x = 15213: 00111011 01101101
txx = 231435369: 00001101 11001011 01101100 01101001
xx = 27753: 00000000 00000000 01101100 01101001
xx2 = -10030: 11111111 11111111 11011000 11010010
```

## Observations

- **Casting order important**
  - If either operand `int`, will perform `int` multiplication
  - If both operands `short int`, will perform `short int` multiplication
- **Really is modular arithmetic**
  - Computes for `xx`:  $15213^2 \bmod 65536 = 27753$
  - Computes for `xx2`:  $(\text{int}) 55506U = -10030$
- **Note that `xx2 == (xx << 1)`**

# Power-of-2 Multiply with Shift

## Operation

- $u \ll k$  gives same result as  $u * 2^k$
- Both signed and unsigned

## Examples

- $u \ll 3 \quad == \quad u * 8$
- $u \ll 5 - u \ll 3 \quad == \quad u * 24$
- **Most machines shift and add much faster than multiply**
  - Compiler will generate this code automatically

# Unsigned Power-of-2 Divide with Shift

## Quotient of Unsigned by Power of 2

- $u \gg k$  gives same result as  $u / 2^k$
- Uses logical shift

|           | Division   | Computed | Hex   | Binary            |
|-----------|------------|----------|-------|-------------------|
| $x$       | 15213      | 15213    | 3B 6D | 00111011 01101101 |
| $x \gg 1$ | 7606.5     | 7606     | 1D B6 | 00011101 10110110 |
| $x \gg 4$ | 950.8125   | 950      | 03 B6 | 00000011 10110110 |
| $x \gg 8$ | 59.4257813 | 59       | 00 3B | 00000000 00111011 |

# 2's Comp Power-of-2 Divide with Shift

## Quotient of Signed by Power of 2

- $u \gg k$  *almost* gives same result as  $u / 2^k$
- Uses arithmetic shift
- Rounds wrong direction when  $u < 0$

|           | Division    | Computed | Hex   | Binary                    |
|-----------|-------------|----------|-------|---------------------------|
| $y$       | -15213      | -15213   | C4 93 | 11000100 10010011         |
| $y \gg 1$ | -7606.5     | -7607    | E2 49 | <b>1</b> 1100010 01001001 |
| $y \gg 4$ | -950.8125   | -951     | FC 49 | <b>1111</b> 1100 01001001 |
| $y \gg 8$ | -59.4257813 | -60      | FF C4 | <b>11111111</b> 11000100  |

# Properties of Unsigned Arithmetic

## Unsigned Multiplication with Addition Forms Commutative Ring

- Addition is commutative group

- Closed under multiplication

$$0 \leq \text{UMult}_w(u, v) < 2^w - 1$$

- Multiplication Commutative

$$\text{UMult}_w(u, v) = \text{UMult}_w(v, u)$$

- Multiplication is Associative

$$\text{UMult}_w(t, \text{UMult}_w(u, v)) = \text{UMult}_w(\text{UMult}_w(t, u), v)$$

- 1 is multiplicative identity

$$\text{UMult}_w(u, 1) = u$$

- Multiplication distributes over addition

$$\text{UMult}_w(t, \text{UAdd}_w(u, v)) = \text{UAdd}_w(\text{UMult}_w(t, u), \text{UMult}_w(t, v))$$

# Properties of Two's Comp. Arithmetic

## Isomorphic Algebras

- **Unsigned multiplication and addition**
  - Truncating to  $w$  bits
- **Two's complement multiplication and addition**
  - Truncating to  $w$  bits

## Both Form Rings

- Isomorphic to ring of integers mod  $2^w$

## Comparison to Integer Arithmetic

- Both are rings
- Integers obey ordering properties, e.g.,

$$u > 0 \qquad u + v > v$$

$$u > 0, v > 0 \qquad u \cdot v > 0$$

- **These properties are not obeyed by two's complement arithmetic**

$$TMax + 1 \quad == \quad TMin$$

$$15213 * 30426 == -10030$$

# C Puzzle Answers

- Assume machine with 32 bit word size, two's complement integers
- *TMin* makes a good counterexample in many cases

- |                                             |                                   |                                         |
|---------------------------------------------|-----------------------------------|-----------------------------------------|
| • <code>x &lt; 0</code>                     | <code>((x*2) &lt; 0)</code>       | <b>False:</b> <i>TMin</i>               |
