Memory Management III: Perils and pitfalls
Oct 15, 1998

Topics

• Review of C pointer references
• Memory-related bugs
• Debugging versions of malloc
• Binary translation
• Garbage collection
C operators

Operators

()  []  ->  .
!  ~  ++  --  +  -  *  &  (type)  sizeof
*  /  %
+  -
<<  >>
<  <=  >  >=
==  !=
&
^  |
&&
||
?:
=  +=  -=  *=  /=  %=  &=  ^=  !=  <<=  >>=
,

Associativity

left to right
right to left
left to right
left to right
left to right
left to right
left to right
left to right
left to right
right to left
left to right
left to right
right to left
left to right

Note: Unary +, -, and * have higher precedence than binary forms
C pointer declarations

`int *p`  
`p` is a pointer to `int`

`int *p[13]`  
`p` is an array[13] of pointer to `int`

`int *(p[13])`  
`p` is an array[13] of pointer to `int`

`int **p`  
`p` is a pointer to a pointer to an `int`

`int (*p)[13]`  
`p` is a pointer to an array[13] of `int`

`int *f()`  
`f` is a function returning a pointer to `int`

`int (*f)()`  
`f` is a pointer to a function returning `int`

`int (***f())[13]()`  
`f` is a function returning ptr to an array[13] of pointers to functions returning `int`

`int (**(*x[3]))[5]()`  
`x` is an array[3] of pointers to functions returning pointers to array[5] of `ints`
Memory-related bugs

- Dereferencing bad pointers
- Reading uninitialized memory
- Overwriting memory
- Referencing nonexistent variables
- Freeing blocks multiple times
- Referencing freed blocks
- Failing to free blocks
Dereferencing bad pointers

The classic scanf bug

```c
scanf("%d", val);
```
Reading uninitialized memory

Assuming that heap data is initialized to zero

```c
/* return y = Ax */
int *matvec(int **A, int *x) {
    int *y = malloc(N*sizeof(int));
    int i, j;

    for (i=0; i<N; i++)
        for (j=0; j<N; j++)
            y[i] += A[i][j]*x[j];
    return y;
}
```
Overwriting memory

Allocating the wrong sized object

```c
int **p;
p = malloc(N*sizeof(int));
for (i=0; i<N; i++) {
    p[i] = malloc(M*sizeof(int));
}
```
Overwriting memory

Off-by-one

```c
int **p;
p = malloc(N*sizeof(int *));
for (i=0; i<=N; i++) {
    p[i] = malloc(M*sizeof(int));
}
```
Overwriting memory

*Off-by-one redux*

```c
int i, done=0;
int s[4];

while (!done) {
    if (i > 3)     done = 1;
    else     s[++i] = 10;
}
```
Overwriting memory

Forgetting that strings end with ‘/0’

```c
char t[7];
char s[8] = "1234567";
strcpy(t, s);
```
Overwriting memory

Not checking the max string size

```c
char s[8];
int i;

gets(s); /* reads “123456789” from stdin */
```
Overwriting memory

Referencing a pointer instead of the object it points to

```c
int *BinheapDelete(int **binheap, int *size) {
    int *packet;
    packet = binheap[0];
    binheap[0] = binheap[*size - 1];
    *size--;
    Heapify(binheap, *size, 0);
    return(packet);
}
```
Overwriting memory

Misunderstanding pointer arithmetic

```c
search(int *array, int val) {
    while (*p && *p != val)
        p += sizeof(int);
}
```
Referencing nonexistent variables

*Forgetting that local variables disappear when a function returns*

```c
int *foo () {
    int val;
    return &val;
}
```
Freeing blocks multiple times

Nasty!

```c
x = malloc(N*sizeof(int));
<manipulate x>
free(x);

y = malloc(M*sizeof(int));
<manipulate y>
free(x);
```
Referencing freed blocks

\textit{Evil!}

\begin{verbatim}
x = malloc(N*\text{sizeof}(\text{int}));
<\text{manipulate } x> 
free(x);
...
y = malloc(M*\text{sizeof}(\text{int}));
for (i=0; i<M; i++)
    y[i] = x[i]++;
\end{verbatim}
Failing to free blocks (memory leaks)

slow, long-term killer!

foo() {
    int *x = malloc(N*sizeof(int));
    ...
    return;
}
Failing to free blocks (memory leaks)

Freeing only part of a data structure

class16.ppt
Dealing with memory bugs

Conventional debugger (gdb)
  • good for finding bad pointer dereferences
  • hard to detect the other memory bugs

Debugging malloc (CSRI UToronto malloc)
  • wrapper around conventional malloc
  • detects memory bugs at malloc and free boundaries
    – memory overwrites that corrupt heap structures
    – some instances of freeing blocks multiple times
    – memory leaks
  • Cannot detect all memory bugs
    – overwrites into the middle of allocated blocks
    – freeing block twice that has been reallocated in the interim
    – referencing freed blocks
Dealing with memory bugs (cont)

Binary translator (Atom, Purify)
- powerful debugging and analysis technique
- rewrites text section of executable object file
- can detect all errors as debugging malloc
- can also check each individual reference at runtime
  - bad pointers
  - overwriting
  - referencing outside of allocated block

Garbage collection (Boehm-Weiser Conservative GC)
- let the system free blocks instead of the programmer
Debugging malloc

mymalloc.h:
#define malloc(size) mymalloc(size, __FILE__, __LINE__)
#define free(p) myfree(p, __FILE__, __LINE__)

Application program:
ifdef DEBUG
#include <mymalloc.h>
endif

main() {
    ...
    p = malloc(128);
    ...
    free(p);
    ...
    q = malloc(32);
    ...
}
Debugging malloc library:

```c
void *mymalloc(int size, char *file, int line) {
    <prologue code>
    p = malloc(...);
    <epilogue code>
    return q;
}

void myfree(void *p, char *file, int line) {
    <prologue code>
    free(p);
    <epilogue code>
}
```
Debugging malloc (cont)

- block size
- block ID
- file name (of allocation)
- line number (of allocation)
- checksum (of previous fields)
- ptr to next allocated block
- ptr to prev allocated block
- guard bytes

Block requested by application

header

application block

footer

guard bytes
Debugging malloc (cont)

mymalloc(size):
• \( p = \text{malloc}(\text{size} + \text{sizeof(header)} + \text{sizeof(footer)}) \);
• add \( p \) to list of allocated blocks
• initialize application block to 0xdeadbeef
• return pointer to application block

myfree(p):
• already free (line \# = 0xefefefefefefefe)?
• checksum OK?
• guard bytes OK?
• free(p - \text{sizeof(hdr)});
• line \# = 0xefefefefefefefe;
Binary translator

Converts an executable object file to an instrumented executable object file.

Diagram:
- Original object file (hello)
- Binary translator (e.g. Atom)
- Instrumentation file (ptrace.inst.c)
- Analysis file (ptrace.anal.c)
- Instrumented object file (hello.ptrace)
Atom example
(procedure call tracing)

Instrumentation file (ptrace.inst.c):

```c
#include <stdio.h>
#include <instrument.h>

Instrument() {
    Proc *proc;
    AddCallProto("ProcTrace(char*)");

    for (proc = GetFirstProc(); proc != NULL; proc = GetNextProc(proc))
        AddCallProc(proc, ProcBefore, "ProcTrace", ProcName(proc));
}
```

Analysis file (ptrace.anal.c):

```c
#include <stdio.h>

void ProcTrace(char *name) {
    printf("%s\n", name);
}
```
Instrumenting “hello,world”

% cc -Wl,r -non_shared hello.c -o hello.rr
% atom hello.rr ptrace.inst.c ptrace.anal.c -o hello.ptrace
% hello.ptrace

Atom tools

iprod - instruction profiling
liprof - instruction profiling at basic block level
syscall - syscall trace and performance analyzer
memsys - memory system simulator
io - io performance summary
gprof - call graph execution time profile
3rd - memory checker and leak finder (like Purify)
pixie - basic block profiling
Garbage collector

**Garbage**: unreachable allocated memory blocks (nodes).
- no pointers in registers, on stack, or in global variables (roots)
- no pointers in any allocated heap blocks reachable from the roots
Garbage collector

*Garbage collection:* automatic reclamation of heap-allocated storage after its last use by a program

```c
void foo() {
    int *p = malloc(128);
    return; /* p block is now garbage */
}
```

Common in functional languages and modern object oriented languages:

- Lisp, ML, Java

Variants (conservative garbage collectors) exist for C and C++
Classical GC algorithms

Reference counting (Collins, 1960)
  • described here

Mark and sweep collection (McCarthy, 1960)

Copying collection (Minsky, 1963)
  • not described here
Reference counting

Assume this format for each node

<table>
<thead>
<tr>
<th>rc</th>
<th>left</th>
<th>right/next</th>
</tr>
</thead>
</table>

New () {
    newcell = allocate();
    newcell->rc = 1;
    return newcell;
}

Delete(T) {
    T->rc--;
    if (T->rc == 0) {
        foreach (U in Children(T))
            Delete(U);
        Free(T);
    }
}

Update(R,S) {
    Delete(R);
    S->rc++;
    R = S;
}

Free(U) {
    U->next = free_list;
    free_list = U;
}
Reference counting example

Initially, before Update(right(R), NULL)
Reference counting example

after Delete(right(R))
Reference counting example

after Delete(left(S))
Reference counting example

after Update(right(R), NULL)
Reference counting cyclic data structures

before Delete(right(R))

after Delete(right(R))
