"The course that gives CMU its Zip!"

Structured Data I: Homogenous Data February 8, 2001

Topics

- Arrays
 - Single
 - Nested
- Pointers
 - Multilevel Arrays
- Optimized Array Code

class08.ppt

Basic Data Types

Integral

• Stored & operated on in general registers
• Signed vs. unsigned depends on instructions used
Intel GAS Bytes C
byte b 1 [unsigned] char
word w 2 [unsigned] short
double word l 4 [unsigned] int

Floating Point

• Stored & operated on in floating point registers
Intel GAS Bytes C
Single s 4 float
Double l 8 double
Extended t 10/12 long double

Pointer

• Stored & operated on in general registers
Intel GAS Bytes C
Double l 8 char *

class08.ppt

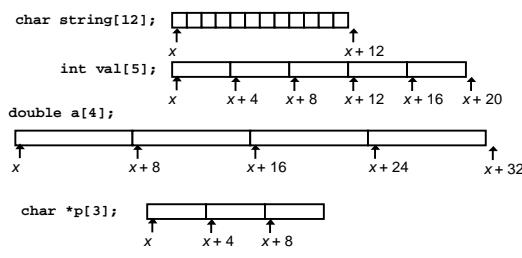

[-2 -]

[CS 213 S'01]

Array Allocation

Basic Principle

- $T A[L];$
- Array named A of data type T with L elements
 - Contiguously allocated region of $L * \text{sizeof}(T)$ bytes

class08.ppt

[-3 -]

Array Access

Basic Principle

- $T A[1..L];$
- Array named A of data type T and length L
 - Identifier A can be used as a pointer to starting element of the array

Reference	Type	Value
val[4]	int	3
val	int *	x
val+1	int *	$x+4$
val+2	int *	$x+8$
val[5]	int	??
*(val+1)	int	5
val + i	int *	$x+4i$

class08.ppt

[-4 -]

[CS 213 S'01]

Array Example

```
typedef int zip_dig[5];

zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };

zip_dig cmu; [ 1 | 5 | 2 | 1 | 3 ]
              ↑   ↑   ↑   ↑   ↑
              16  20  24  28  32  36
zip_dig mit; [ 0 | 2 | 1 | 3 | 9 ]
              ↑   ↑   ↑   ↑   ↑
              36  40  44  48  52  56
zip_dig ucb; [ 9 | 4 | 7 | 2 | 0 ]
              ↑   ↑   ↑   ↑   ↑
              56  60  64  68  72  76
```

Notes

- Declaration “`zip_dig cmu`” equivalent to “`int cmu[5]`”
- Example arrays were allocated in successive 20 byte blocks
- Not guaranteed to happen in general

class08.ppt

[- 5 -]

[CS 213 S'01]

Array Accessing Example

Computation

- Register `%edx` contains starting address of array
- Register `%eax` contains array index
- Desired digit at $4 * \%eax + \%edx$
- Use memory reference $(\%edx, \%eax, 4)$

```
int get_digit
(zip_dig z, int dig)
{
    return z[dig];
}
```

Memory Reference Code

```
# %edx = z
# %eax = dig
movl (%edx,%eax,4),%eax # z[dig]
```

class08.ppt

[- 6 -]

[CS 213 S'01]

Referencing Examples

```
zip_dig cmu; [ 1 | 5 | 2 | 1 | 3 ]
              ↑   ↑   ↑   ↑   ↑
              16  20  24  28  32  36
zip_dig mit; [ 0 | 2 | 1 | 3 | 9 ]
              ↑   ↑   ↑   ↑   ↑
              36  40  44  48  52  56
zip_dig ucb; [ 9 | 4 | 7 | 2 | 0 ]
              ↑   ↑   ↑   ↑   ↑
              56  60  64  68  72  76
```

Code Does Not Do Any Bounds Checking!

Reference	Address	Value	Guaranteed?
<code>mit[3]</code>	$36 + 4 * 3 = 48$	3	Yes
<code>mit[5]</code>	$36 + 4 * 5 = 56$	9	No
<code>mit[-1]</code>	$36 + 4 * -1 = 32$	3	No
<code>cmu[15]</code>	$16 + 4 * 15 = 76$??	No

- Out of range behavior implementation-dependent
- No guaranteed relative allocation of different arrays

class08.ppt

[- 7 -]

[CS 213 S'01]

Array Loop Example

Original Source

```
int zd2int(zip_dig z)
{
    int i;
    int zi = 0;
    for (i = 0; i < 5; i++) {
        zi = 10 * zi + z[i];
    }
    return zi;
}
```

Transformed Version

- Eliminate loop variable `i`
- Convert array code to pointer code
- Express in do-while form
 - No need to test at entrance

```
int zd2int(zip_dig z)
{
    int zi = 0;
    int *zend = z + 4;
    do {
        zi = 10 * zi + *z;
        z++;
    } while(z <= zend);
    return zi;
}
```

class08.ppt

[- 8 -]

[CS 213 S'01]

Array Loop Implementation

Registers

%ecx z
%eax zi
%ebx zend

Computations

- $10 * zi + *z$ implemented as $*z + 2 * (zi + 4 * zi)$
- $z++$ increments by 4

```
int zd2int(zip_dig z)
{
    int zi = 0;
    int *zend = z + 4;
    do {
        zi = 10 * zi + *z;
        z++;
    } while(z <= zend);
    return zi;
}
```

```
# %ecx = z
xorl %eax,%eax      # zi = 0
leal 16(%ecx),%ebx   # zend = z+4
.L59:
    leal (%eax,%eax,4),%edx # 5*zi
    movl (%ecx),%eax       # *z
    addl $4,%ecx           # z++
    leal (%eax,%edx,2),%eax # zi = *z + 2*(5*zi)
    cmpl %ebx,%ecx         # z : zend
    jle .L59               # if <= goto loop
```

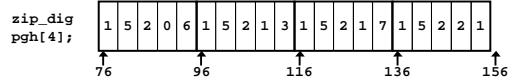

class08.ppt

- 9 -

[CS 213 S'01]

Nested Array Example

```
#define PCOUNT 4
zip_dig pgh[PCOUNT] =
{{1, 5, 2, 0, 6},
 {1, 5, 2, 1, 3},
 {1, 5, 2, 1, 7},
 {1, 5, 2, 2, 1}};
```

- Declaration “zip_dig pgh[4]” equivalent to “int pgh[4][5]”

- Variable pgh denotes array of 4 elements
 - Allocated contiguously
- Each element is an array of 5 int's
 - Allocated contiguously

- “Row-Major” ordering of all elements guaranteed

class08.ppt

- 10 -

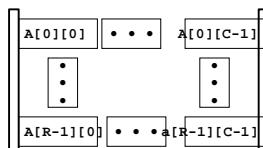

[CS 213 S'01]

Nested Array Allocation

Declaration

$T A[R][C]$;
• Array of data type T
• R rows

• C columns
• Type T element requires K bytes

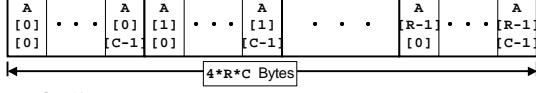

Array Size

- $R * C * K$ bytes

Arrangement

- Row-Major Ordering

int A[R][C];

class08.ppt

- 11 -

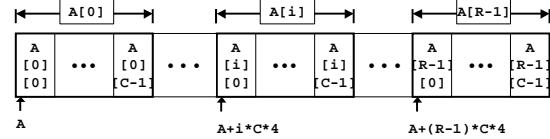

[CS 213 S'01]

Nested Array Row Access

Row Vectors

- $A[i]$ is array of C elements
- Each element of type T
- Starting address $A + i * C * K$

int A[R][C];

class08.ppt

- 12 -

[CS 213 S'01]

Nested Array Row Access Code

```
int *get_pgh_zip(int index)
{
    return pgh[index];
}
```

Row Vector

- $pgh[index]$ is array of 5 int's
- Starting address $pgh + 20 * index$

Code

- Computes and returns address
- Compute as $pgh + 4 * (index + 4 * index)$

```
# %eax = index
leal (%eax,%eax,4),%eax # 5 * index
leal pgh(%eax,%eax,4),%eax # pgh + (20 * index)
```

class08.ppt

-13-

CS 213 S'01

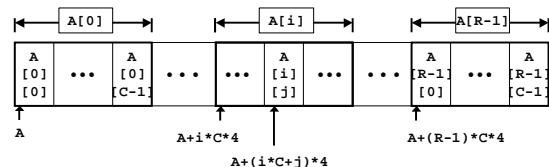

Nested Array Element Access

Array Elements

- $A[i][j]$ is element of type T
- Address $A + (i * C + j) * K$

int A[R][C];

class08.ppt

-14-

CS 213 S'01

Nested Array Element Access Code

Array Elements

- $pgh[index][dig]$ is int
- Address: $pgh + 20 * index + 4 * dig$

```
int get_pgh_digit
    (int index, int dig)
{
    return pgh[index][dig];
}
```

Code

- Computes address
- $pgh + 4 * dig + 4 * (index + 4 * index)$
- movl performs memory reference

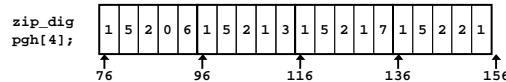

```
# %ecx = dig
# %eax = index
leal 0(%ecx,4),%edx      # 4*dig
leal (%eax,%eax,4),%eax # 5*index
movl pgh(%edx,%eax,4),%eax # *(pgh + 4*dig + 20*index)
```

class08.ppt

-15-

CS 213 S'01

Strange Referencing Examples

Reference	Address	Value Guaranteed?
pgh[3][3]	$76 + 20 * 3 + 4 * 3 = 148$	2 Yes
pgh[2][5]	$76 + 20 * 2 + 4 * 5 = 136$	1 Yes
pgh[2][-1]	$76 + 20 * 2 + 4 * -1 = 112$	3 Yes
pgh[4][-1]	$76 + 20 * 4 + 4 * -1 = 152$	1 Yes
pgh[0][19]	$76 + 20 * 0 + 4 * 19 = 152$	1 Yes
pgh[0][-1]	$76 + 20 * 0 + 4 * -1 = 72$?? No
• Code does not do any bounds checking		
• Ordering of elements within array guaranteed		

class08.ppt

-16-

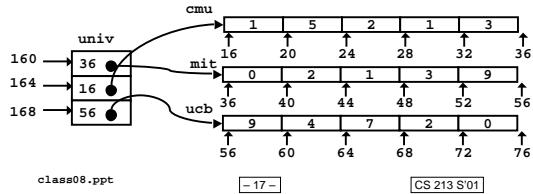

CS 213 S'01

Multi-Level Array Example

- Variable `univ` denotes array of 3 elements
- Each element is a pointer
-4 bytes
- Each pointer points to array of int's

```
zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };

#define UCOUNT 3
int *univ[UCOUNT] = {mit, cmu, ucb};
```

class08.ppt

- 17 -

CS 213 S'01

Referencing “Row” in Multi-Level Array

Row Vector

- `univ[index]` is pointer to array of int's
- Starting address `Mem[univ+4*index]`

```
int* get_univ_zip(int index)
{
    return univ[index];
}
```

Code

- Computes address within `univ`
- Reads pointer from memory and returns it

```
# %edx = index
leal 0(%ecx,%eax,4),%eax # 4*index
movl univ(%eax),%eax # *(univ+4*index)
```

class08.ppt

- 18 -

CS 213 S'01

Accessing Element in Multi-Level Array

Computation

- Element access
`Mem[Mem[univ+4*index]+4*dig]`
- Must do two memory reads
 - First get pointer to row array
 - Then access element within array

```
int get_univ_digit
    (int index, int dig)
{
    return univ[index][dig];
}
```

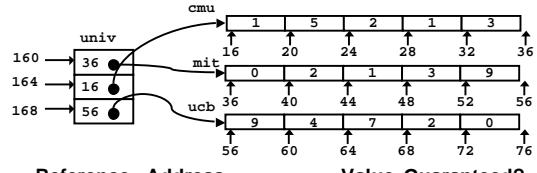

```
# %ecx = index
# %eax = dig
leal 0(%ecx,%eax,4),%edx # 4*index
movl univ(%edx),%edx # Mem[univ+4*index]
movl (%edx,%eax,4),%eax # Mem[univ+4*index+4*dig]
```

class08.ppt

- 19 -

CS 213 S'01

Strange Referencing Examples

Reference Address

univ[2][3]	$56+4*3 = 68$	2	Yes
univ[1][5]	$16+4*5 = 36$	0	No
univ[2][-1]	$56+4*-1 = 52$	9	No
univ[3][-1]	??	??	No
univ[1][12]	$16+4*12 = 64$	7	No

- Code does not do any bounds checking
- Ordering of elements in different arrays not guaranteed

class08.ppt

- 20 -

CS 213 S'01

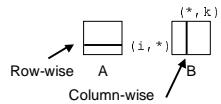

Using Nested Arrays

Strengths

- C compiler handles doubly subscripted arrays
- Generates very efficient code
- Avoids multiply in index computation

Limitation

- Only works if have fixed array size

class08.ppt

```
#define N 16
typedef int fix_matrix[N][N];

/* Compute element i,k of
   fixed matrix product */
int fix_prod_ele
(fix_matrix a, fix_matrix b,
 int i, int k)
{
    int j;
    int result = 0;
    for (j = 0; j < N; j++)
        result += a[i][j]*b[j][k];
    return result;
}
```

[– 21 –]

CS 213 S'01

Dynamic Nested Arrays

Strength

- Can create matrix of arbitrary size

Programming

- Must do index computation explicitly

Performance

- Accessing single element costly
- Must do multiplication

```
int * new_var_matrix(int n)
{
    return (int *)
        calloc(sizeof(int), n*n);
}
```

```
int var_ele
(int *a, int i,
 int j, int n)
{
    return a[i*n+j];
}
```

```
movl 12(%ebp),%eax # i
movl 8(%ebp),%edx # a
imull 20(%ebp),%eax # n*i
addl 16(%ebp),%eax # n*i+j
movl (%edx,%eax,4),%eax # Mem[a+4*(i*n+j)]
```

class08.ppt

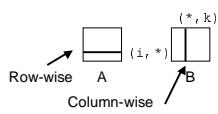

[– 22 –]

CS 213 S'01

Dynamic Array Multiplication

Without Optimizations

- Multiplies
 - 2 for subscripts
 - 1 for data
- Adds
 - 4 for array indexing
 - 1 for loop index
 - 1 for data

class08.ppt

```
/* Compute element i,k of
   variable matrix product */
int var_prod_ele
(int *, int *,
 int i, int k, int n)
{
    int j;
    int result = 0;
    for (j = 0; j < n; j++)
        result +=
            a[i*n+j] * b[j*n+k];
    return result;
}
```

[– 23 –]

CS 213 S'01

Optimizing Dynamic Array Multiplication

Optimizations

- Performed when set optimization level to -O2

Code Motion

- Expression $i*n$ can be computed outside loop

Strength Reduction

- Incrementing j has effect of incrementing $j*n+k$ by n

Performance

- Compiler can optimize regular access patterns

```
{
    int j;
    int result = 0;
    for (j = 0; j < n; j++)
        result +=
            a[i*n+j] * b[j*n+k];
    return result;
}
```

```
{
    int j;
    int result = 0;
    int itn = i*n;
    int jtNpk = k;
    for (j = 0; j < n; j++) {
        result +=
            a[itn+j] * b[jtNpk];
        jtNpk += n;
    }
    return result;
}
```

class08.ppt

[– 24 –]

CS 213 S'01

```
{
    int j;
    int result = 0;
    int iTn = i*n;
    int jTnPk = k;
    for (j = 0; j < n; j++) {
        result += a[iTn+j] * b[jTnPk];
        jTnPk += n;
    }
    return result;
}
```

Dynamic Array Multiplication

%ecx	result
%edx	j
%esi	n
%ebx	jTnPk
Mem[-4(%ebp)]	iTn

```
.L44:           # loop
    movl -4(%ebp),%eax      # iTn
    movl 8(%ebp),%edi       # a
    addl %edx,%eax          # iTn+j
    movl (%edi,%eax,4),%eax # a[iTn+j]
    movl 12(%ebp),%edi      # b
    incl %edx                # j++
    imull (%edi,%ebx,4),%eax # b[jTnPk]*a[iTn+j]
    addl %eax,%ecx          # result += ..
    addl %esi,%ebx          # jTnPk += n
    cmpl %esi,%edx          # j : n
    jl .L44                 # if < goto loop
```

Inner Loop

Summary

Arrays in C

- Contiguous allocation of memory
- Pointer to first element
- No bounds checking

Compiler Optimizations

- Compiler often turns array code into pointer code
- Uses addressing modes to scale array indices
- Lots of tricks to improve array indexing in loops
 - code motion
 - reduction in strength

class08.ppt
