### 15-213

# VirtualMemory April3,2001

#### **Topics**

- MotivationsforVM
- Addresstranslation
- Acceleratingtranslationwith TLBs

### **MotivationsforVirtualMemory**

- UsePhysicalDRAMasaCachefortheDisk
  - Addressspaceofaprocesscanexceedphysicalmemorysize
  - Sumofaddressspacesofmultipleprocessescanexceedphysical memory
- SimplifyMemoryManagement
  - Multipleprocessesresidentinmainmemory.
    - Eachprocesswithitsownaddressspace
  - Only "active" code and data is a ctually in memory
    - Allocatemorememorytoprocessasneeded.

#### **ProvideProtection**

- Oneprocesscan'tinterferewithanother.
  - becausetheyoperateindifferentaddressspaces.
- Userprocesscannotaccessprivilegedinformation
  - different sections of address spaces have different permissions.

### Motivation#1:DRAMa"Cache"forDisk

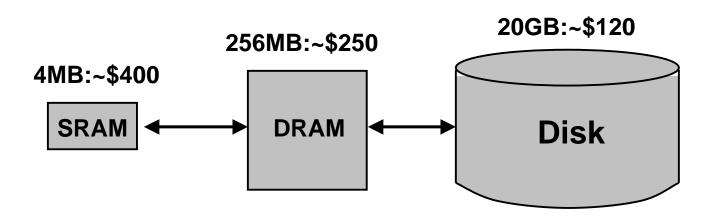

#### Fulladdressspaceisquitelarge:

- 32-bitaddresses:~4,000,000,000(4billion) bytes
- 64-bitaddresses:~16,000,000,000,000,000,000(16quintillion)byte

#### Diskstorageis~170XcheaperthanDRAMstorage

- 20GBofDRAM:~\$20,000
- 20GBofdisk:~\$120

# Toaccesslargeamountsofdatainacost -effective manner,thebulkofthedatamustbestoredondisk

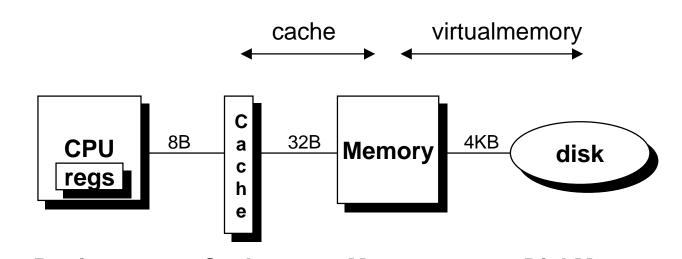

class20.ppt

CS213S'01

S

### LevelsinMemoryHierarchy

	Register	Cacne	wemory	Diskillemory
size:	32B	32KB -4MB	128MB	20GB
speed:	1ns	2ns	50ns	8ms
\$/Mbyte:		\$100/MB	\$1.00/MB	\$0.006/MB
linesize:	8B	32B	4KB	

larger,slower,cheaper

#### DRAMvs.SRAMasa"Cache"

#### DRAMvs.diskismoreextremethanSRAMvs.DRAM

- Accesslatencies:
  - -DRAM~10XslowerthanSRAM
  - Disk~ 100,000X slowerthanDRAM
- Importanceofexploitingspatiallocality:
  - Firstbyteis~ 100,000X slowerthansuccessivebytesondisk» vs.~4Ximprovementforpage -modevs.regularaccessestoDRAM
- Bottomline:
  - DesigndecisionsmadeforDRAMcachesdrivenbyenormouscostof misses

### ImpactofThesePropertiesonDesign

If DRAMwastobeorganized similar to an SRAM cache, how would we set the following design parameters?

• Linesize?

\_

Associativity?

\_

• Writethroughorwriteback?

\_

Whatshouldtheimpactofthesechoicesbeon:

missrate

\_

hittime

\_

misslatency

\_

tagstorageoverhead

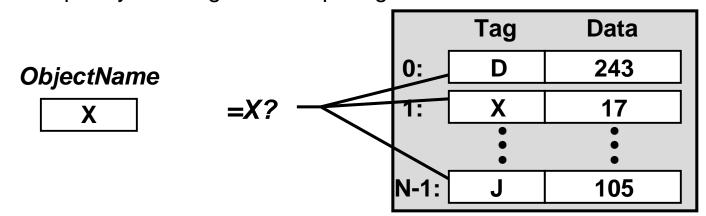

\_

### LocatinganObjectina"Cache"

#### **SRAMCache**

- Tagstoredwithcacheline
- Mapsfromcacheblocktomemoryblocks
  - Fromcachedto uncached form
- Notagforblocknotincache
- Hardwareretrievesinformation
  - canquicklymatchagainstmultipletags

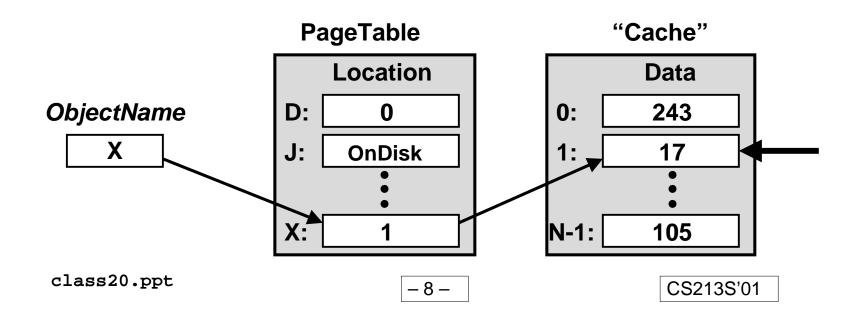

"Cache"

### LocatinganObjectina "Cache" (cont.)

#### **DRAMCache**

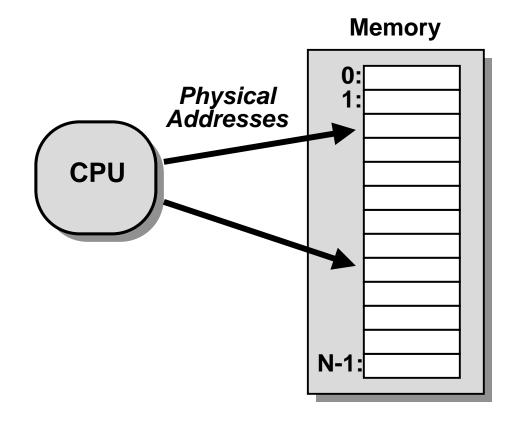

- Eachallocatepageofvirtualmemoryhasentryinpagetable
- Mappingfromvirtualpagestophysicalpages
  - From uncached formtocachedform
- Pagetableentryevenifpagenotinmemory
  - Specifiesdiskaddress
- OSretrievesinformation

### **ASystemwithPhysicalMemoryOnly**

#### **Examples:**

• mostCraymachines,earlyPCs,nearlyallembeddedsystems,etc.

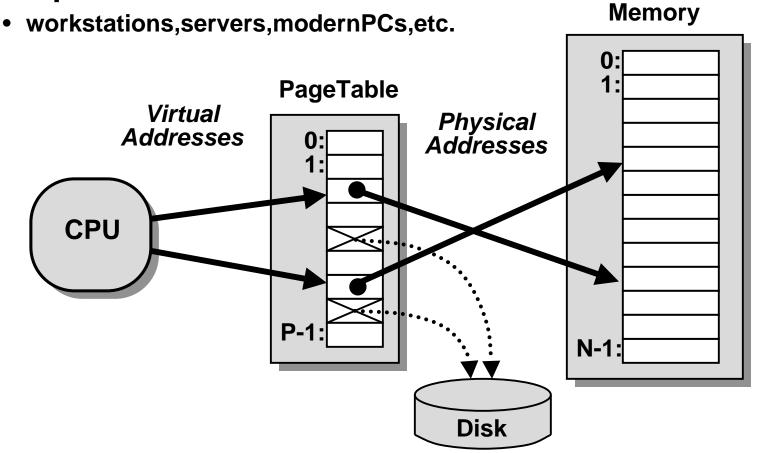

AddressesgeneratedbytheCPUpointdirectlytobytesinphysic

almemory

### **ASystemwithVirtualMemory**

#### **Examples:**

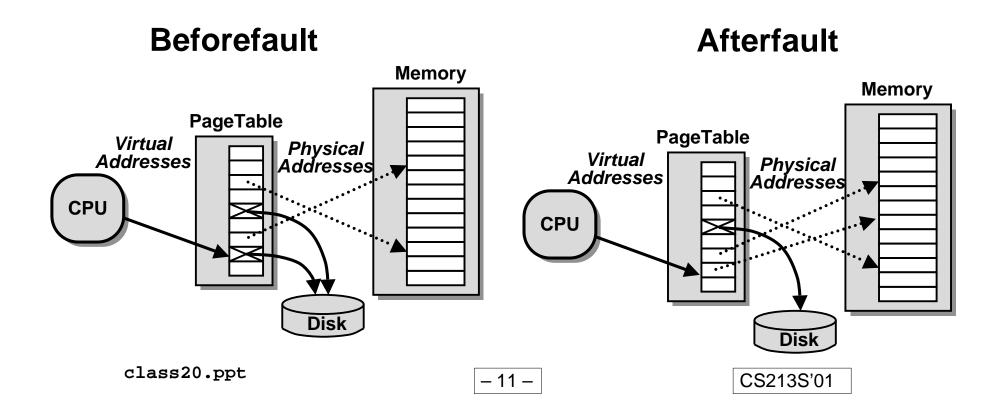

<u>AddressTranslation:</u> Hardwareconverts *virtualaddresses* to *physicaladdresses* viaanOS -managedlookuptable( *pagetable*)

### PageFaults(Similarto"CacheMisses")

#### Whatifanobjectisondiskratherthaninmemory?

- Pagetableentryindicatesvirtualaddressnotinmemory
- OSexceptionhandlerinvokedtomovedatafromdiskintomemory
  - -currentprocesssuspends,otherscanresume
  - -OShasfullcontroloverplacement,etc.

### ServicingaPageFault

## ProcessorSignals Controller

 ReadblockoflengthP startingatdiskaddress Xandstorestartingat memoryaddressY

#### **ReadOccurs**

- DirectMemoryAccess (DMA)
- UndercontrolofI/O controller

# I/OController SignalsCompletion

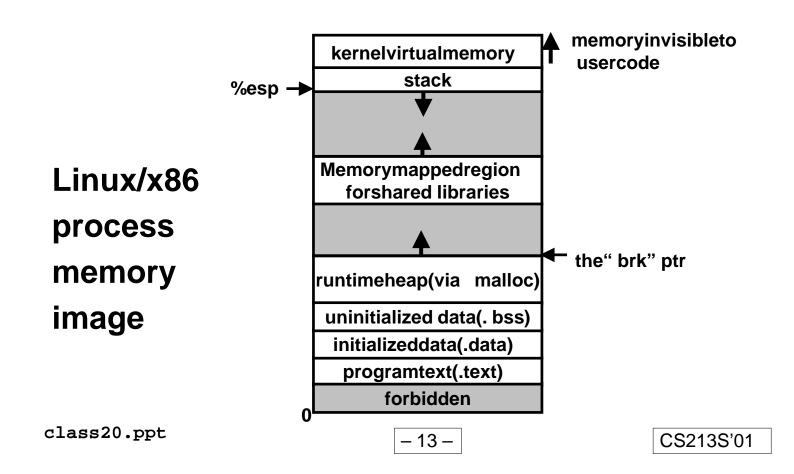

- Interruptprocessor
- OSresumessuspended process

### Motivation#2:MemoryManagement

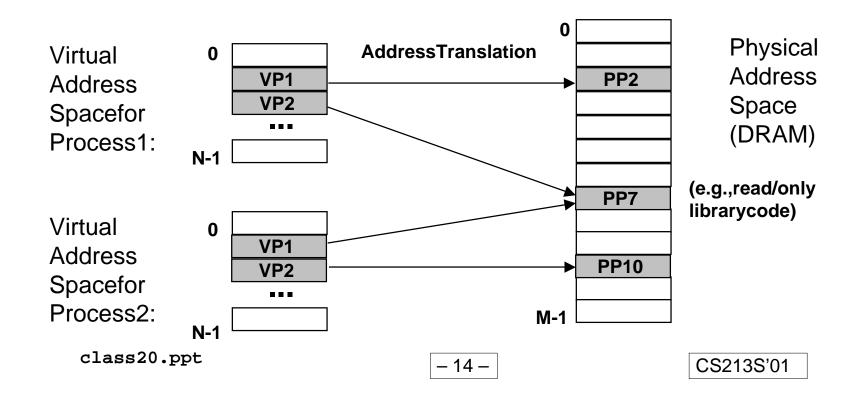

Multipleprocessescanresideinphysicalmemory. Howdoweresolveaddressconflicts?

whatiftwoprocessesaccesssomethingatthesameaddress?

### Solution: Separate Virtual Addr. Spaces

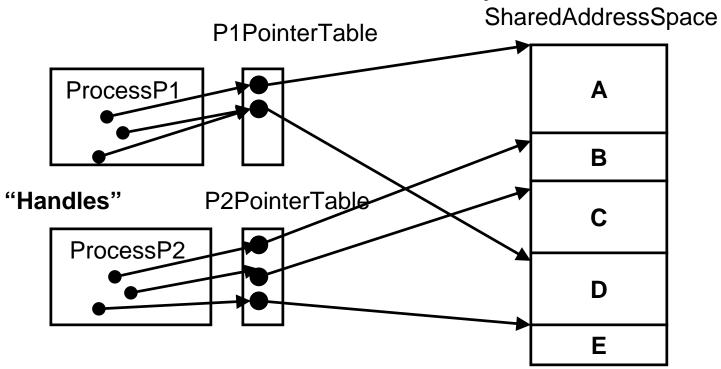

- Virtualandphysicaladdressspacesdividedintoequal -sizedblocks
  - blocksarecalled"pages"(bothvirtualandphysical)
- Eachprocesshasitsownvirtualaddressspace
  - operatingsystemcontrolshowvirtualpagesasassignedtophysi cal memory

### Contrast:MacintoshMemoryModel

#### MACOS1 -9

Doesnotusetraditionalvirtualmemory

#### Allprogramobjectsaccessedthrough "handles"

- Indirectreferencethroughpointertable
- Objectsstoredinsharedglobaladdressspace

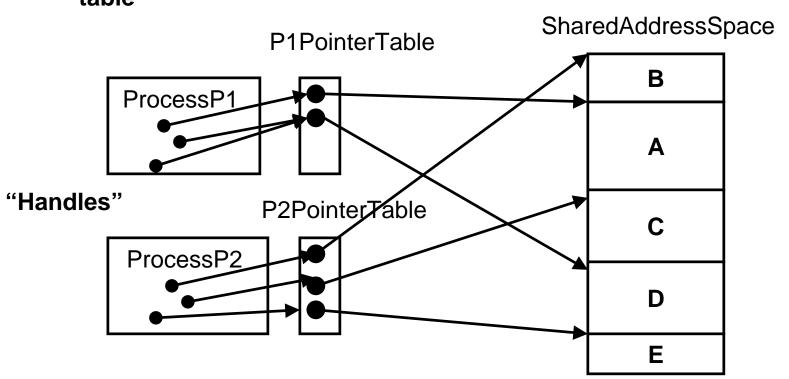

### MacintoshMemoryManagement

#### **Allocation/ Deallocation**

• Similartofree -listmanagementof malloc/free

#### Compaction

Canmoveanyobjectandjustupdatethe(unique)pointerinpoin ter table

### Macvs.VM -BasedMemoryMgmt

#### Allocating, deallocating, and moving memory:

canbeaccomplishedbybothtechniques

#### **Blocksizes:**

- Mac:variable -sized
  - maybeverysmallorverylarge
- VM:fixed -size
  - -sizeisequalto onepage (4KBonx86Linuxsystems)

#### Allocatingcontiguouschunksofmemory:

- Mac:contiguousallocationis required
- VM:canmapcontiguousrangeofvirtualaddressestodisjoint rangesofphysicaladdresses

#### **Protection**

• Mac: "wildwrite" by one process can corrupt another's data

#### **MACOSX**

#### "Modern" Operating System

- Virtualmemorywithprotection
- Preemptivemultitasking
  - OtherversionsofMACOSrequireprocessestovoluntarilyrelinq control

uish

#### **BasedonMACHOS**

• DevelopedatCMUinlate1980's

#### Motivation#3:Protection

#### **Protectiongoals:**

- Cannotread/writememoryfromanotherprocess
- Cannotwriteintosharedlibraries

#### Processescanonlyseevirtualaddresses

- Cannotgettophysicaladdressesdirectly
- Canonlygothroughthepagetable
- Ifaphysicalpageisnotinaprocess'pagetable,itis"invis ible"

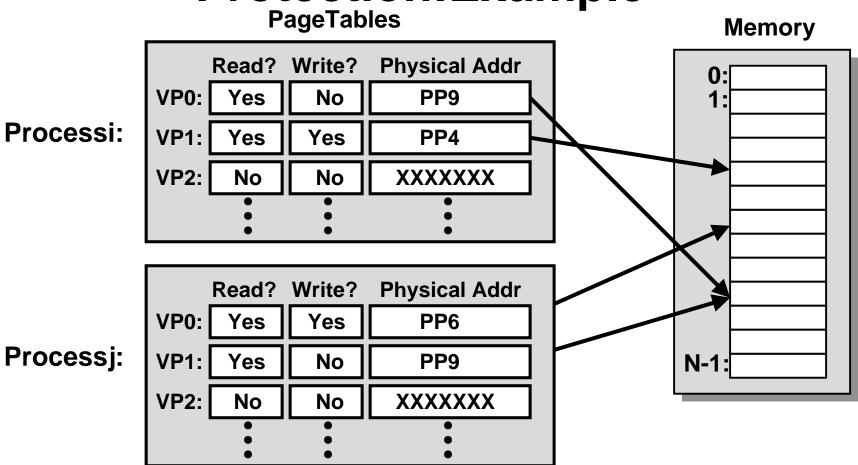

#### Pagetableentrycontainsaccessrightsinformation

- hardwareenforcesthisprotection(trapintoOSifviolationocc urs)
- Thepagetableitselfisinprotectedmemory

#### Whenallocatinganewphysicalpage, it is cleared

• Importantthattheprocesscannotseethepreviouscontents

- Processiandjcanonlyreadphysicalpage9
- Processicannotevenseepage6

### MotivationsforVirtualMemory

- UsePhysicalDRAMasaCachefortheDisk
  - Addressspaceofaprocesscanexceedphysicalmemorysize
  - Sumofaddressspacesofmultipleprocessescanexceedphysical memory
- SimplifyMemoryManagement
  - Multipleprocessesresidentinmainmemory.
    - Eachprocesswithitsownaddressspace
  - Only "active" code and data is a ctually in memory
    - Allocatemorememorytoprocessasneeded.

#### **ProvideProtection**

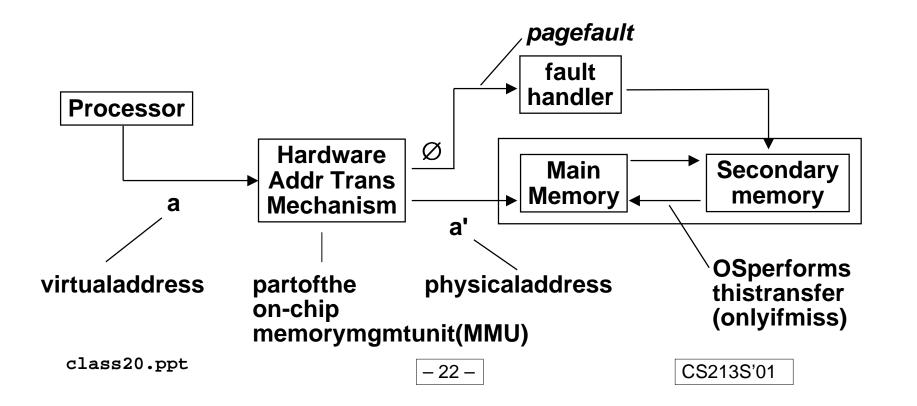

- Oneprocesscan'tinterferewithanother.
  - becausetheyoperateindifferentaddressspaces.
- Userprocesscannotaccessprivilegedinformation
  - different sections of address spaces have different permissions.

### **VMAddressTranslation**

V={0,1,...,N -1}virtualaddressspace N>M P={0,1,...,M -1}physicaladdressspace

MAP:V  $\rightarrow$  PU{  $\varnothing$ }addressmappingfunction

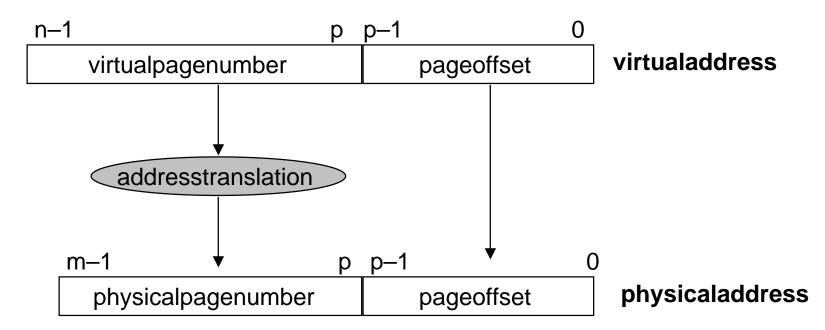

MAP(a) =a'ifdataatvirtualaddress  $\underline{a}$  ispresentatphysical address  $\underline{a'}$  inP =  $\emptyset$  ifdataatvirtualaddressaisnotpresentinP

### **VMAddressTranslation**

#### **Parameters**

- P=2 p =pagesize(bytes).
- N=2 n = Virtual address limit
- M=2 <sup>m</sup> =Physicaladdresslimit

Noticethatthepageoffsetbitsdon'tchangeasaresultoftra

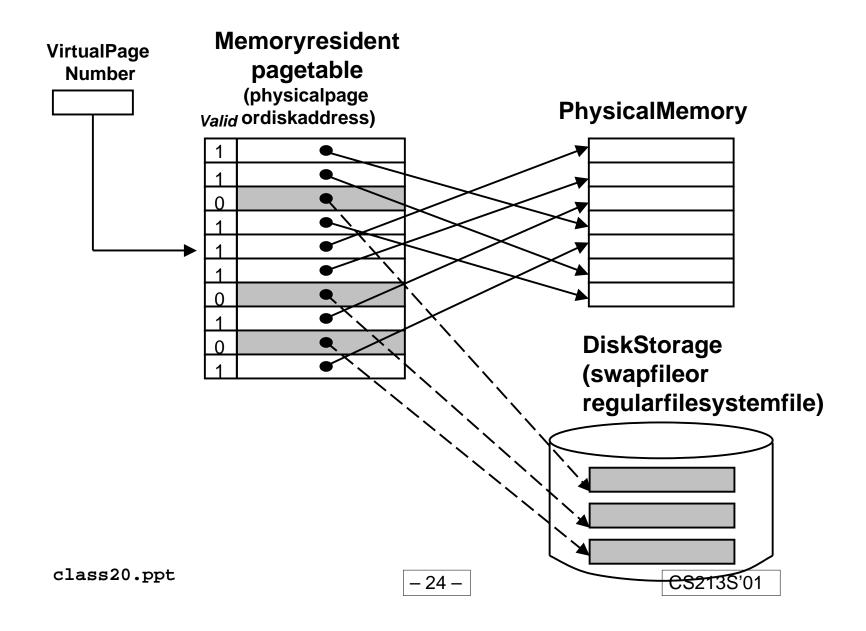

nslation

class20.ppt

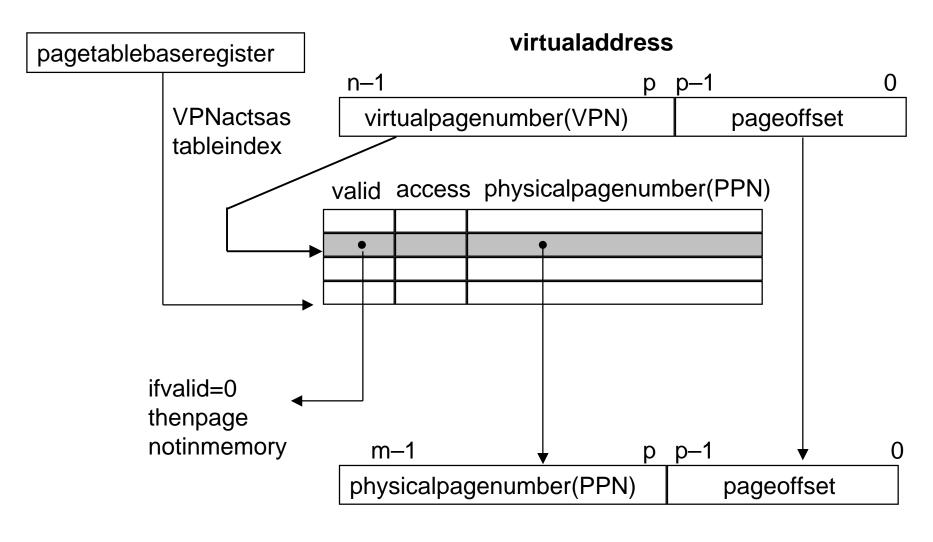

-23-

CS213S'01

### **PageTables**

### AddressTranslationviaPageTable

physicaladdress

class20.ppt

**- 25 -**

CS213S'01

### **PageTableOperation**

#### **Translation**

- Separate(setof)pagetable(s)perprocess
- VPNformsindexintopagetable(pointstoapagetableentry)

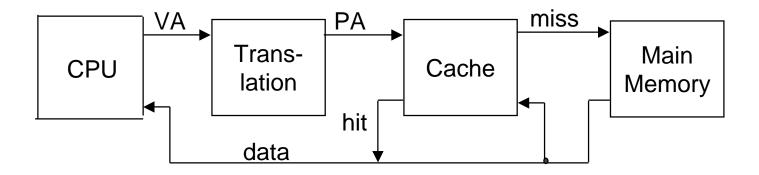

#### ComputingPhysicalAddress

- PageTableEntry(PTE)providesinformationaboutpage
  - if(validbit=1)thenthepageisinmemory.
    - » Usephysicalpagenumber(PPN)toconstructaddress
  - if(validbit=0)thenthepageisondisk
    - » Pagefault
    - » Mustloadpagefromdiskintomainmemorybeforecontinuing

#### **CheckingProtection**

- Accessrightsfieldindicateallowableaccess
  - -e.g.,read -only,read -write,execute -only
  - -typicallysupportmultipleprotectionmodes(e.g.,kernelvs.us er)
- Protectionviolationfaultifuserdoesn'thavenecessarypermis sion

### IntegratingVMandCache

#### MostCaches"PhysicallyAddressed"

- Accessedbyphysicaladdresses
- Allowsmultipleprocessestohaveblocksincacheatsametime
- Allowsmultipleprocessestosharepages
- Cachedoesn'tneedtobeconcernedwithprotectionissues
  - Accessrightscheckedaspartofaddresstranslation

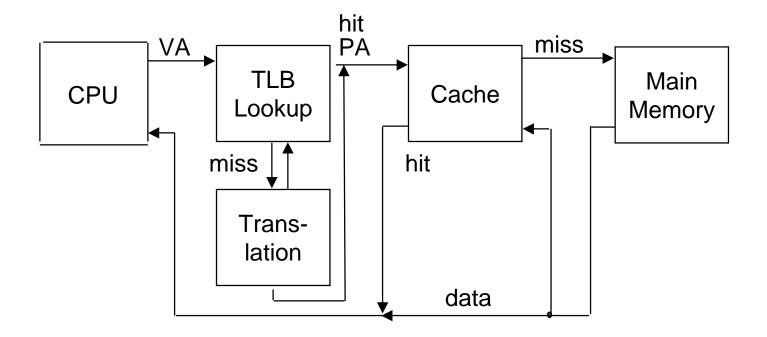

#### PerformAddressTranslationBeforeCacheLookup

- Butthiscouldinvolveamemoryaccessitself(ofthePTE)
- Ofcourse,pagetableentriescanalsobecomecached

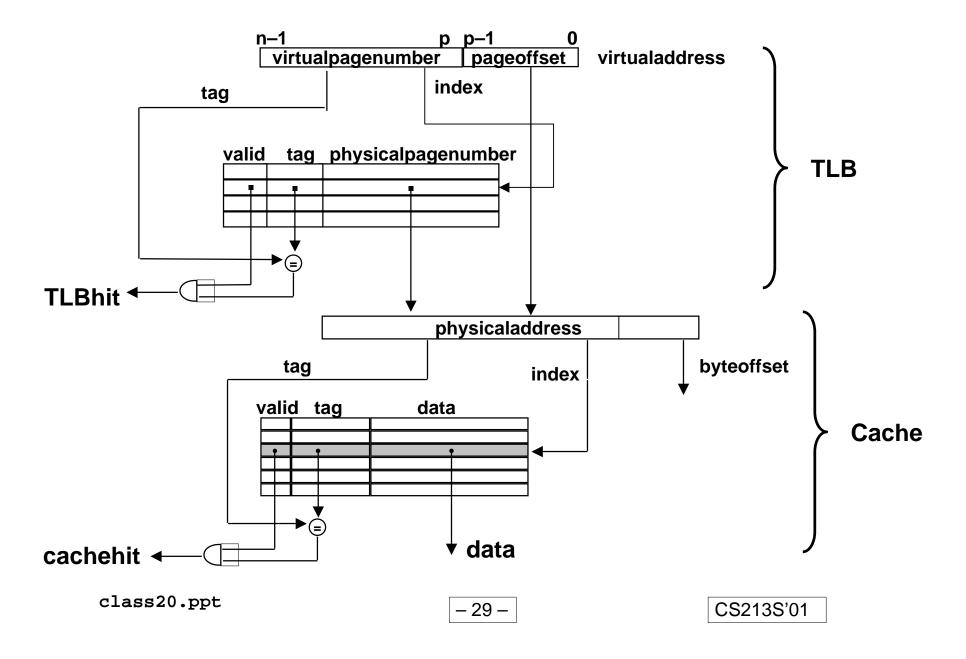

### **SpeedingupTranslationwithaTLB**

#### "Translation Lookaside Buffer" (TLB)

- SmallhardwarecacheinMMU(MemoryManagementUnit)
- Mapsvirtualpagenumberstophysicalpagenumbers
- Containscompletepagetableentriesforsmallnumberofpages

### AddressTranslationwithaTLB

### **ExampleSizes**

#### VirtualAddress(32bits)

- 19bitspagenumber
- 13bitspageoffset(8 Kbyte pages)

#### **TLB**

- 128entries
- 4-waysetassociative
- HowmanybitsistheTLBtag?

#### L1Cache

- 32Kbytes
- 4-waysetassociative
- 32-bytelinesize
- HowmanybitsintheCacheTag?

#### **Virtualaddress**

tag	idx	pageoffset
-----	-----	------------

#### physicaladdress

tag	idx	offst

### Multi-LevelPageTables

#### Given:

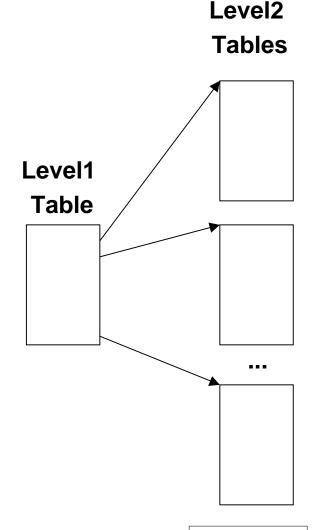

- 4KB(2 12)pagesize
- 32-bitaddressspace
- 4-bytePTE

#### **Problem:**

- Wouldneeda4MBpagetable!
  - $-2^{20} * 4 bytes$

#### Commonsolution

- multi-levelpagetables
- e.g.,2 -leveltable(P6)
  - Level1table:1024entries,eachof whichpointstoaLevel2pagetable.
  - Level2table:1024entries,eachof whichpointstoapage

### **MainThemes**

#### Programmer's View

- Large"flat"addressspace
  - Canallocatelargeblocksofcontiguousaddresses
- Processor"owns"machine
  - Hasprivateaddressspace
  - Unaffectedbybehaviorofotherprocesses

#### **SystemView**

- Uservirtualaddressspacecreatedbymappingtosetofpages
  - Neednotbecontiguous
  - Allocateddynamically
  - Enforceprotectionduring address translation
- OSmanagesmanyprocessessimultaneously
  - Continuallyswitchingamongprocesses
  - Especiallywhenonemustwaitforresource
    - » E.g., diskl/Otohandlepagefault
