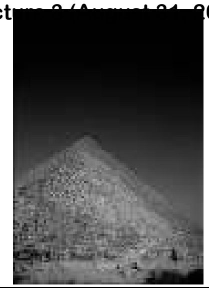
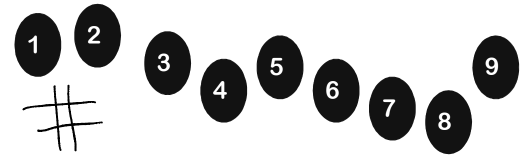
Ancient Wisdom: Unary and Binary

Lect 2010)



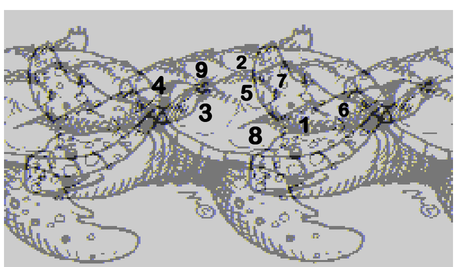
How to play the 9 stone game?



9 stones, numbered 1-9
Two players alternate moves.
Each move a player gets to take a new stone

Any subset of 3 stones adding to 15, wins.

Magic Square: Brought to humanity on the back of a tortoise from the river Lo in the days of Emperor Yu in ancient China



Magic Square: Any 3 in a vertical, horizontal, or diagonal line add up to 15.

4	9	2
3	5	7
8	1	6

Conversely, any 3 that add to 15 must be on a line.

4	9	2
3	5	7
8	1	6

TIC-TAC-TOE on a Magic Square Represents The Nine Stone Game

Alternate taking squares 1-9. Get 3 in a row to win.

4	9	2
3	5	7
8	1	6

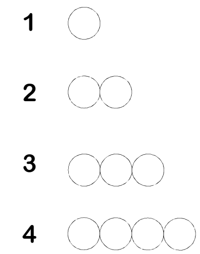
Basic Idea of this Lecture

Don't stick with the representation in which you encounter problems!

Always seek the more useful one!

This idea requires a lot of practice

Prehistoric Unary



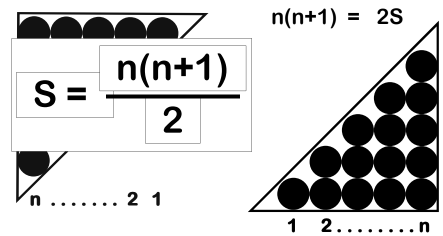
Consider the problem of finding a formula for the sum of the first n numbers

You already used induction to verify that the answer is ½n(n+1)

$$1 + 2 + 3 + \ldots + n\text{-}1 + n = S$$
$$n + n\text{-}1 + n\text{-}2 + \ldots + 2 + 1 = S$$
$$n\text{+}1 + n\text{+}1 + n\text{+}1 + \ldots + n\text{+}1 + n\text{+}1 = 2S$$
$$n(n+1) = 2S$$
$$S = \frac{n(n+1)}{2}$$

$$\boxed{1 + 2 + 3 + \ldots + n\text{-}1 + n = S}$$
$$\boxed{n + n\text{-}1 + n\text{-}2 + \ldots + 2 + 1 = S}$$

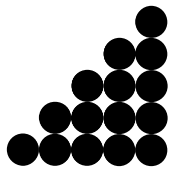
$$n(n+1) = 2S$$



$$S = \frac{n(n+1)}{2}$$

n^{th} Triangular Number

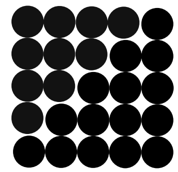
$$\Delta_n = 1 + 2 + 3 + \ldots + n\text{-}1 + n$$
$$= n(n+1)/2$$

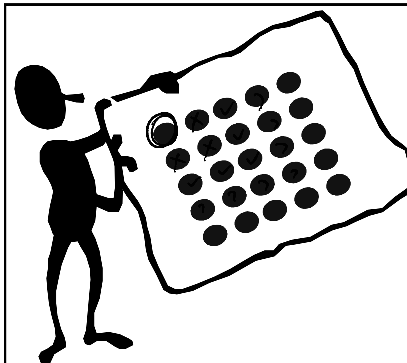


n^{th} Square Number

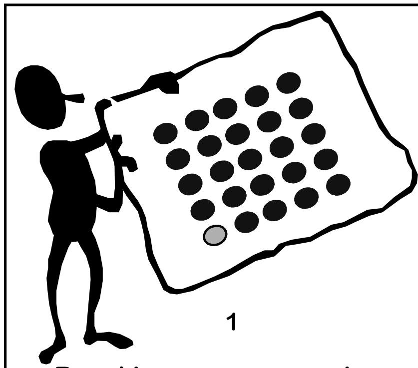
$$\square_n = n^2$$
$$= \Delta_n + \Delta_{n-1}$$

$$n^2 = \frac{n(n+1)}{2} + \frac{n(n-1)}{2}$$



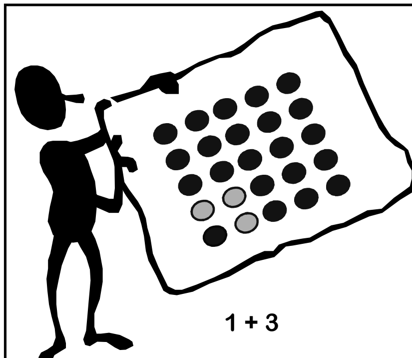


Breaking a square up in a new way



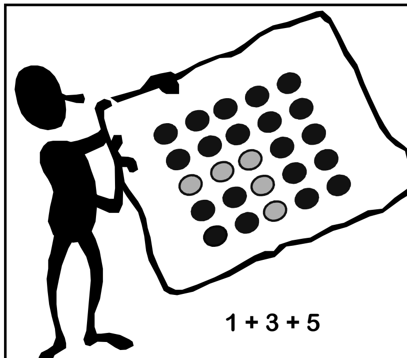
1

Breaking a square up in a new way



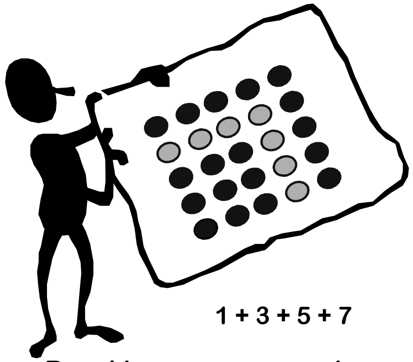
1 + 3

Breaking a square up in a new way



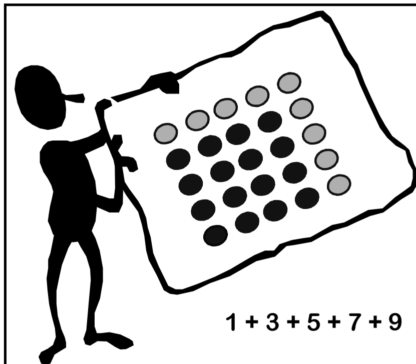
1 + 3 + 5

Breaking a square up in a new way



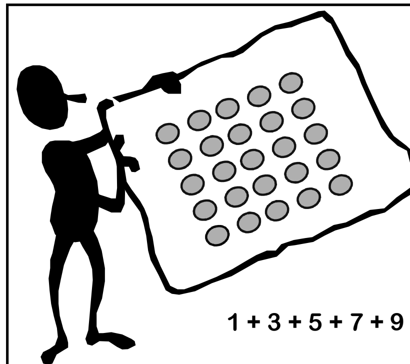
$1 + 3 + 5 + 7$

Breaking a square up in a new way



$1 + 3 + 5 + 7 + 9$

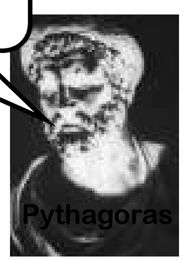
Breaking a square up in a new way



$1 + 3 + 5 + 7 + 9 = 5^2$

Breaking a square up in a new way

The sum of the first n odd numbers is n^2

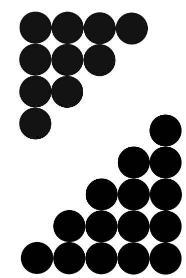


Here is an alternative dot proof of the same sum….

n^{th} Square Number

$\square_n = \Delta_n + \Delta_{n-1}$

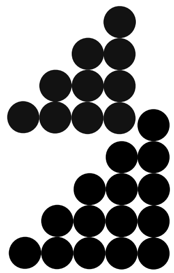
$= n^2$



n^{th} Square Number

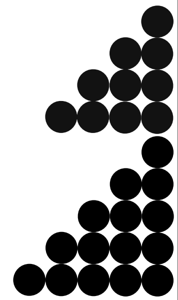
$\square_n = \Delta_n + \Delta_{n-1}$

$= n^2$



n^{th} Square Number

$\square_n = \Delta_n + \Delta_{n-1}$



n^{th} Square Number

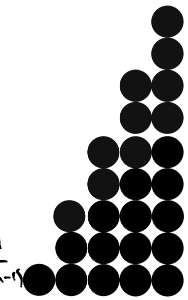
$\square_n = \Delta_n + \Delta_{n-1}$

= Sum of first n odd numbers

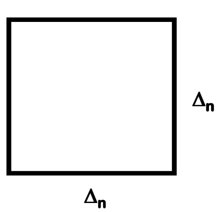
$\Delta_n = 1 + 2 + 3 \cdot \cdot + n-1 + n$

$\Delta_{n-1} = \quad 1 + 2 + \quad + n-2 + n-1$

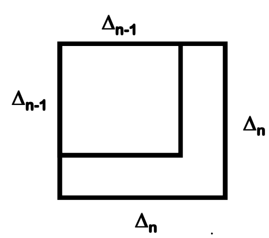
$\overline{\quad 1 + 3 + 5 + \quad (2n-3) + (2n-1)}$



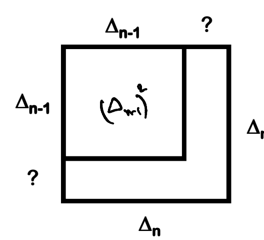
Area of square $= (\Delta_n)^2$



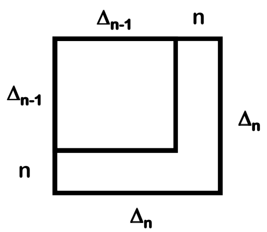
Area of square $= (\Delta_n)^2$



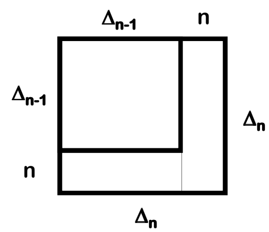
Area of square $= (\Delta_n)^2$



Area of square $= (\Delta_n)^2$

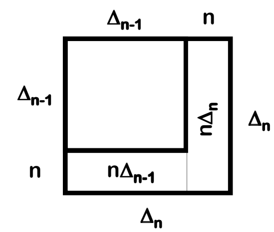


Area of square $= (\Delta_n)^2$



Area of square $= (\Delta_n)^2$

$$
\begin{aligned}
&= (\Delta_{n-1})^2 + n\Delta_{n-1} + n\Delta_n \\
&= (\Delta_{n-1})^2 + n(\Delta_{n-1} + \Delta_n) \\
&= (\Delta_{n-1})^2 + n(\square_n) \\
&= (\Delta_{n-1})^2 + n^3
\end{aligned}
$$



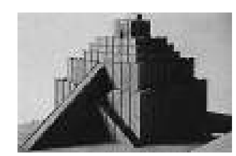
$$
\begin{aligned}
(\Delta_n)^2 &= n^3 + (\Delta_{n-1})^2 \\
&= n^3 + (n-1)^3 + (\Delta_{n-2})^2 \\
&= n^3 + (n-1)^3 + (n-2)^3 + (\Delta_{n-3})^2 \\
&= n^3 + (n-1)^3 + (n-2)^3 + \ldots + 1^3
\end{aligned}
$$

$$
\begin{aligned}
(\Delta_n)^2 &= 1^3 + 2^3 + 3^3 + \ldots + n^3 \\
&= [\, n(n+1)/2 \,]^2
\end{aligned}
$$

Can you find a formula for the sum of the first n squares?

$\frac{1}{6} n(n+1)(2n+1)$

Babylonians needed this sum to compute the number of blocks in their pyramids



Rhind Papyrus

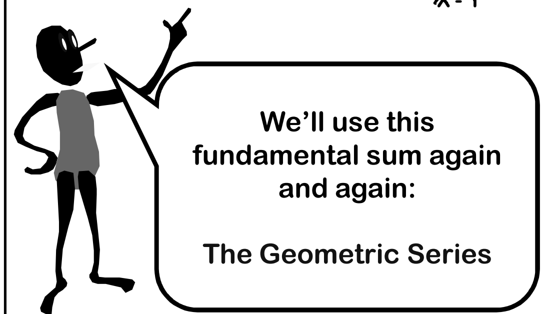
Scribe Ahmes was Martin Gardener of his day!

A man has 7 houses,
Each house contains 7 cats,
Each cat has killed 7 mice,
Each mouse had eaten 7 ears of spelt,
Each ear had 7 grains on it.
What is the total of all of these?

Sum of powers of 7

$$1+7+7^2+7^3+7^4+7^5 = \frac{7^6-1}{6}$$

$$1 + X^1 + X^2 + X^3 + \ldots + X^{n-2} + X^{n-1} = \frac{X^n-1}{X-1}$$



A Frequently Arising Calculation

$$(X-1)\,(1 + X^1 + X^2 + X^3 + \ldots + X^{n-2} + X^{n-1})$$

A Frequently Arising Calculation

$$(X-1)\,(1 + X^1 + X^2 + X^3 + \ldots + X^{n-2} + X^{n-1})$$

$$\begin{aligned} = \quad & \cancel{X^1} + \cancel{X^2} + \cancel{X^3} + \cancel{\ldots} + \cancel{X^{n-1}} + X^n \\ - \; & 1 - \cancel{X^1} - \cancel{X^2} - \cancel{X^3} - \ldots - \cancel{X^{n-2}} - \cancel{X^{n-1}} \\ \hline = \quad & X^n - 1 \end{aligned}$$

$$1 + X^1 + X^2 + X^3 + \ldots + X^{n-2} + X^{n-1} = \frac{X^n - 1}{X - 1}$$
(when $x \neq 1$)

Geometric Series for X=2

$$1 + 2^1 + 2^2 + 2^3 + \ldots + 2^{n-1} = 2^n - 1$$
2^0

$$2^1 + 2^2 + 2^3 + \ldots + 2^n = 2^{n+1} - 2$$

$$1 + X^1 + X^2 + X^3 + \ldots + X^{n-2} + X^{n-1} = \frac{X^n - 1}{X - 1}$$
(when $x \neq 1$)

Geometric Series for X=½

$$1 + \tfrac{1}{2} + \tfrac{1}{2}^2 + \tfrac{1}{2}^3 + \ldots + \tfrac{1}{2}^{n-1} = \frac{(\frac{1}{2})^n - 1}{\frac{1}{2} - 1}$$

$$= 2\left(1 - \left(\tfrac{1}{2}\right)^n\right)$$

$$1 + X^1 + X^2 + X^3 + \ldots + X^{n-2} + X^{n-1} = \frac{X^n - 1}{X - 1}$$
(when $x \neq 1$)

A Similar Sum

$a^n + a^{n-1}b^1 + a^{n-2}b^2 + + \ldots + a^1b^{n-1} + b^n$

$$= a^n\left(1 + \left(\frac{b}{a}\right) + \frac{b^2}{a^2} + \frac{b^3}{a^3} + \cdots + \frac{b^n}{a^n}\right)$$

$$= a^n\left(\frac{(b/a)^{n+1} - 1}{b/a - 1}\right) = \frac{b^n - a^n}{b - a}$$

A slightly different one

$0.2^0 + 1.2^1 + 2.2^2 + 3.2^3 + \ldots + n2^n = ?$

$$\begin{aligned} S &= 0.2^0 + 1.2^1 + 2.2^2 + 3.2^3 + \ldots + n2^n \\ -\ 2S &= 0.2^1 + 1.2^2 + 2.2^3 + 3.2^4 + \ldots + (n-1)2^n + n.2^{n+1} \end{aligned}$$

$$-S = 0.2^0 + \underbrace{1.2^1 + 1.2^2 + 1.2^3 + 1.2^4 + \ldots + 1.2^n}_{2^{n+1} - 2} - n.2^{n+1}$$

$-S = 2^{n+1} - 2 - n.2^{n+1} = -2^{n+1}(n-1) - 2$

$S = 2^{n+1}(n-1) + 2$

Check Your Work!

$0.2^0 + 1.2^1 + 2.2^2 + 3.2^3 + \ldots + n2^n = S$

We're claiming: $S = 2^{n+1}(n-1) + 2$

What is $S + (n+1)2^{n+1}$?

$2^{n+1}(n-1) + 2 + (n+1)2^{n+1}$

$= 2^{n+1}(2n) + 2$

$= 2^{n+2}(n) + 2$

$= 2^{(n+1)+1}((n+1)-1) + 2$

Also, for n=0 both are 0.

Two Case Studies

Bases and Representation

BASE X Representation

$S = a_{n-1}\, a_{n-2} \ldots a_1\, a_0$ represents the number:

$a_{n-1} X^{n-1} + a_{n-2} X^{n-2} + \ldots + a_0 X^0$

Base 2 [Binary Notation]

101 represents: $1(2)^2 + 0(2^1) + 1(2^0)$

= 

Base 7

015 represents: $0(7)^2 + 1(7^1) + 5(7^0)$

= 

Bases In Different Cultures

Sumerian-Babylonian: 10, 60, 360
Egyptians: 3, 7, 10, 60
Maya: 20
Africans: 5, 10
French: 10, 20
English: 10, 12, 20

BASE X Representation

$S = (a_{n-1}\ a_{n-2} \ldots a_1\ a_0)_X$ represents the number:

$a_{n-1} X^{n-1} + a_{n-2} X^{n-2} + \ldots + a_0 X^0$

Largest number representable in base-X with n "digits"

$= (X\text{-}1\ X\text{-}1\ X\text{-}1\ X\text{-}1\ X\text{-}1 \ldots X\text{-}1)_X$

$= (X-1)(X^{n-1} + X^{n-2} + \ldots + X^0)$

$= (X^n - 1)$

Fundamental Theorem For Binary

Each of the numbers from 0 to 2^n-1is uniquely represented by an n-bit number in binary

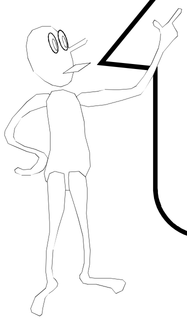
k uses $\lfloor \log_2 k \rfloor + 1$ digits in base 2

$= \lceil \log_2 (k+1) \rceil$

Fundamental Theorem For Base-X

Each of the numbers from 0 to X^n-1 is uniquely represented by an n-"digit" number in base X

k uses $\lfloor \log_X k \rfloor + 1$ digits in base X



n has length n in unary, but has length $\lfloor \log_2 n \rfloor + 1$ in binary

Unary is exponentially longer than binary

Other Representations: Egyptian Base 3

Conventional Base 3:
Each digit can be 0, 1, or 2

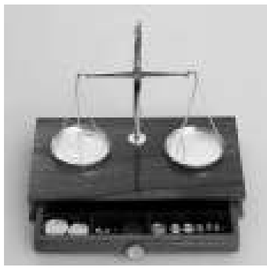
Here is a strange new one:
Egyptian Base 3 uses -1, 0, 1

Example: $(1\ {-1}\ {-1})_{EB3} = 9 - 3 - 1 = 5$

$(1\ 1\ 1 \quad)$ $\quad 1+3+9+\ldots+3^{n-1} = \frac{3^n-1}{2}$

We can prove a unique representation theorem

How could this be Egyptian? Historically, negative numbers first appear in the writings of the Hindu mathematician Brahmagupta (628 AD)



One weight for each power of 3
Left = “negative”. Right = “positive”

Two Case Studies

Bases and Representation

Solving Recurrences
using a good representation

Example

$T(1) = 1$
$T(n) = 4T(n/2) + n$

Notice that T(n) is inductively defined only for positive powers of 2, and undefined on other values

$T(1) = 1 \quad T(2) = 6 \quad T(4) = 28 \quad T(8) = 120$

Give a closed-form formula for T(n)

Technique 1
Guess Answer, Verify by Induction

$T(1) = 1, T(n) = 4\,T(n/2) + n$

Base Case: $G(1) = 1$ and $T(1) = 1$
Induction Hypothesis: $T(x) = G(x)$ for $x < n$
Hence: $T(n/2) = G(n/2) = 2(n/2)^2 - n/2$

$$\begin{aligned} T(n) &= 4\,T(n/2) + n \\ &= 4\,G(n/2) + n \\ &= 4\,[2(n/2)^2 - n/2] + n \\ &= 2n^2 - 2n + n \\ &= 2n^2 - n = G(n) \end{aligned}$$

Guess:
$G(n) = 2n^2 - n$

Technique 2
Guess Form, Calculate Coefficients

$T(1) = 1, T(n) = 4\,T(n/2) + n$

Guess: $T(n) = an^2 + bn + c$
for some a,b,c

Calculate: $T(1) = 1$, so $a + b + c = 1$

$T(n) = 4\,T(n/2) + n$

$an^2 + bn + c = 4\,[a(n/2)^2 + b(n/2) + c] + n$

$= an^2 + 2bn + 4c + n$

$(b+1)n + 3c = 0$

Therefore: $b = -1 \quad c = 0 \quad a = 2$

Technique 3
The Recursion Tree Approach

$T(1) = 1, T(n) = 4\,T(n/2) + n$

A slight variation

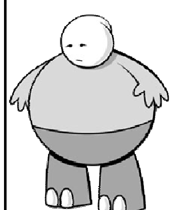
$T(1) = 1,\ T(n) = 4\,T(n/2) + n^2$

How about this one?

$T(1) = 1,\ T(n) = 3\,T(n/2) + n$

… and this one?

$T(1) = 1,\ T(n) = T(n/4) + T(n/2) + n$



Here's What You Need to Know…

Unary and Binary

- Triangular Numbers
- Dot proofs

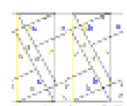
$(1+x+x^2 + \ldots + x^{n-1}) = (x^n - 1)/(x-1)$

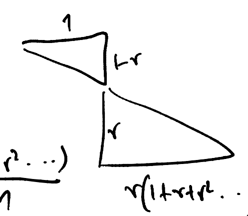
Base-X representations

k uses $\lfloor \log_2 k \rfloor + 1 = \lceil \log_2 (k+1) \rceil$ digits in base 2

Solving Simple Recurrences

Bhaskara's "proof" of Pythagoras' theorem





$$\frac{\cancel{r}}{1-r} = \frac{\cancel{r}(1+r+r^2\cdots)}{1}$$
