Grade School Revisited: How To Multiply Two Numbers

The best way is
often far from
obvious!

Gauss

$(a+bi)(c+di)$

Gauss' Complex Puzzle

Remember how to multiply two
complex numbers $a + bi$ and $c + di$?

$$(a+bi)(c+di) = [ac - bd] + [ad + bc] i$$

Input: a, b, c, d
Output: $ac - bd, ad + bc$

If multiplying two real numbers costs \$1 and adding
them costs a penny, what is the cheapest way to
obtain the output from the input?

Can you do better than \$4.02?

Gauss' \$3.05 Method

Input: a, b, c, d
Output: $ac - bd, ad + bc$

$$(a+bi)(c+di) = [ac - bd] + [ad + bc] i$$

c	$X_1 = a + b$	
c	$X_2 = c + d$	
\$	$X_3 = X_1 X_2$	$= ac + ad + bc + bd$
\$	$X_4 = ac$	
\$	$X_5 = bd$	
c	$X_6 = X_4 - X_5$	$= ac - bd$
cc	$X_7 = X_3 - X_4 - X_5$	$= bc + ad$

The Gauss optimization
saves one multiplication out
of four.
It requires 25% less work.

Time complexity of grade school addition

$T(n)$ = The amount of time grade school addition uses to add two n -bit numbers

We saw that $T(n)$ was linear.

$T(n) = \Theta(n)$

Time complexity of grade school multiplication

$T(n)$ = The amount of time grade school multiplication uses to add two n -bit numbers

We saw that $T(n)$ was quadratic.

$T(n) = \Theta(n^2)$

Grade School Addition: Linear time
Grade School Multiplication: Quadratic time

No matter how dramatic the difference in the constants the quadratic curve will eventually dominate the linear curve

Grade school addition is linear time.

Is there a sub-linear time method for addition?

Any addition algorithm takes $\Omega(n)$ time

Claim: Any algorithm for addition must read all of the input bits

Proof: Suppose there is a mystery algorithm A that does not examine each bit

Give A a pair of numbers. There must be some unexamined bit position i in one of the numbers

Any addition algorithm takes $\Omega(n)$ time

- If A is not correct on the inputs, we found a bug
- If A is correct, flip the bit at position i and give A the new pair of numbers. A gives the same answer as before, which is now wrong.

So any algorithm for addition must use time at least linear in the size of the numbers.

Grade school addition can't be improved upon by more than a constant factor.

Grade School Addition: $\Theta(n)$ time
Furthermore, it is optimal

Grade School Multiplication: $\Theta(n^2)$ time

Is there a clever algorithm to multiply two numbers in linear time?

Despite years of research, no one knows! If you resolve this question, Carnegie Mellon will give you a PhD!

Can we even break the quadratic time barrier?

In other words, can we do something very different than grade school multiplication?

Grade School Multiplication: The Kissing Intuition

Intuition:
Let's say that each time an algorithm has to multiply a digit from one number with a digit from the other number, we call that a "kiss".

It seems as if any correct algorithm must kiss at least n^2 times.

Divide And Conquer

An approach to faster algorithms:

1. DIVIDE a problem into smaller subproblems
2. CONQUER them recursively
3. GLUE the answers together so as to obtain the answer to the larger problem

Multiplication of 2 n-bit numbers

$$X = a \cdot 2^{n/2} + b \quad Y = c \cdot 2^{n/2} + d$$

$$X \times Y = ac \cdot 2^n + (ad + bc) \cdot 2^{n/2} + bd$$

Multiplication of 2 n-bit numbers

$$X \times Y = ac \cdot 2^n + (ad + bc) \cdot 2^{n/2} + bd$$

MULT(X,Y):

If $|X| = |Y| = 1$ then return XY

break X into a;b and Y into c;d

return

$MULT(a,c) \cdot 2^n + (MULT(a,d) + MULT(b,c)) \cdot 2^{n/2} + MULT(b,d)$

Same thing for numbers in decimal!

$$X = a \cdot 10^{n/2} + b \quad Y = c \cdot 10^{n/2} + d$$

$$X \times Y = ac \cdot 10^n + (ad + bc) \cdot 10^{n/2} + bd$$

Multiplying (Divide & Conquer style)

$$12345678 \times 21394276$$

$$\begin{array}{r} *4276 \ 5678 *2139 \quad 5678 *4276 \end{array}$$

$$X = \begin{array}{|c|c|} \hline a & b \\ \hline \end{array} \quad Y = \begin{array}{|c|c|} \hline c & d \\ \hline \end{array}$$

$$X \times Y = (a \cdot 10^n + b) \cdot (c \cdot 10^{n/2} + d)$$

Multiplying (Divide & Conquer style)

$$\begin{array}{r} \text{12345678} * \text{21394276} \\ \text{1234} * 4276 \quad 5678 * 2139 \quad 5678 * 4276 \end{array}$$

$$X = \begin{array}{|c|c|} \hline a & b \\ \hline \end{array} \quad Y = \begin{array}{|c|c|} \hline c & d \\ \hline \end{array}$$

$$X \times Y = (a \cdot 10^n + b) \cdot (c \cdot 10^{n/2} + d)$$

Multiplying (Divide & Conquer style)

$$\begin{array}{r} \text{12345678} * \text{21394276} \\ \text{1234} * 2139 \quad \text{5678} * 2139 \quad 5678 * 4276 \end{array}$$

$$X = \begin{array}{|c|c|} \hline a & b \\ \hline \end{array} \quad Y = \begin{array}{|c|c|} \hline c & d \\ \hline \end{array}$$

$$X \times Y = (a \cdot 10^n + b) \cdot (c \cdot 10^{n/2} + d)$$

Multiplying (Divide & Conquer style)

$1234 \blacksquare * \blacksquare 4276$
 $1234 * 2139 \quad 1234 * 4276 \quad \blacksquare \quad 5678 * 4276$

$X = \begin{bmatrix} a & b \end{bmatrix}$
 $Y = \begin{bmatrix} c & d \end{bmatrix}$
 $X * Y = \dots 10^n + (\dots) 10^{n/2} + \dots$

Multiplying (Divide & Conquer style)

$1234 \blacksquare * 2139 \blacksquare$
 $1234 * 2139 \quad 1234 * 4276 \quad 5678 * 2139 \quad \blacksquare$

$X = \begin{bmatrix} a & b \end{bmatrix}$

 $X * Y = \dots 10^n + (\dots) 10^{n/2} + \dots$

Multiplying (Divide & Conquer style)

$12345678 * 21394276$
 $1234 * 2139 \quad 1234 * 4276 \quad 5678 * 2139 \quad 5678 * 4276$

$X = \begin{bmatrix} a & b \end{bmatrix}$
 $Y = \begin{bmatrix} c & d \end{bmatrix}$
 $X * Y = \dots 10^n + (\dots) 10^{n/2} + \dots$

Multiplying (Divide & Conquer style)

$12345678 * 21394276$
 $\blacksquare 34 * \blacksquare 39 \quad 1234 * 4276 \quad 5678 * 2139 \quad 5678 * 4276$
 $\blacksquare 12 * 39 \quad 34 * 21 \quad 34 * 39 \text{ xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx}$

$X = \begin{bmatrix} a & b \end{bmatrix}$
 $Y = \begin{bmatrix} c & d \end{bmatrix}$
 $X * Y = \dots 10^n + (\dots) 10^{n/2} + \dots$

Multiplying (Divide & Conquer style)

$12345678 * 21394276$
 $\blacksquare 34 * 21 \blacksquare \quad 1234 * 4276 \quad 5678 * 2139 \quad 5678 * 4276$
 $12 * 21 \quad \blacksquare \quad 34 * 21 \quad 34 * 39 \text{ xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx}$

$X = \begin{bmatrix} a & b \end{bmatrix}$
 $Y = \begin{bmatrix} c & d \end{bmatrix}$
 $X * Y = \dots 10^n + (\dots) 10^{n/2} + \dots$

Multiplying (Divide & Conquer style)

$12345678 * 21394276$
 $12 \blacksquare \blacksquare 39 \quad 1234 * 4276 \quad 5678 * 2139 \quad 5678 * 4276$
 $12 * 21 \quad 12 * 39 \quad \blacksquare \quad 34 * 39 \text{ xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx}$

$X = \begin{bmatrix} a & b \end{bmatrix}$
 $Y = \begin{bmatrix} c & d \end{bmatrix}$
 $X * Y = \dots 10^n + (\dots) 10^{n/2} + \dots$

Multiplying (Divide & Conquer style)

12345678 * 21394276

1234*2139 1234*4276 5678*2139 5678*4276

12*21 12*39 34*21 34*39 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

$X = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $Y = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $X * Y = \dots 10^i + (\dots) 10^{i/2} + \dots$

Multiplying (Divide & Conquer style)

12345678 * 21394276

1234*2139 1234*4276 5678*2139 5678*4276

12*21 12*39 34*21 34*39 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

$X = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $Y = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $X * Y = \dots 10^i + (\dots) 10^{i/2} + \dots$

Multiplying (Divide & Conquer style)

12345678 * 21394276

1234*2139 1234*4276 5678*2139 5678*4276

12*21 12*39 34*21 34*39 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

1*2 1*1 2*2 2*1 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

$X = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $Y = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $X * Y = \dots 10^i + (\dots) 10^{i/2} + \dots$

Multiplying (Divide & Conquer style)

12345678 * 21394276

1234*2139 1234*4276 5678*2139 5678*4276

12*21 12*39 34*21 34*39 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

2 1 4 2 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

Hence: $12*21 = 2*10^2 + (1+4)10^1 + 2 = 252$

$X = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $Y = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $X * Y = \dots 10^i + (\dots) 10^{i/2} + \dots$

Multiplying (Divide & Conquer style)

12345678 * 21394276

1234*2139 1234*4276 5678*2139 5678*4276

252 12*39 34*21 34*39 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

2 1 4 2 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

Hence: $12*21 = 2*10^2 + (1+4)10^1 + 2 = 252$

$X = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $Y = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $X * Y = \dots 10^i + (\dots) 10^{i/2} + \dots$

Multiplying (Divide & Conquer style)

12345678 * 21394276

1234*2139 1234*4276 5678*2139 5678*4276

252 12*39 34*21 34*39 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

1*2 1*1 2*2 2*1 xxxxxxxxxxxxxxxxxxxxxxxxxxxx

Hence: $12*21 = 2*10^2 + (1+4)10^1 + 2 = 252$

$X = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$
 $Y = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$

Divide, Conquer, and Glue

8

Divide, Conquer, and Glue

MULT(X,Y):
if $|X| = |Y| = 1$
then return XY,
else...

Divide, Conquer, and Glue

MULT(X,Y):
X=a;b Y=c;d

Divide, Conquer, and Glue

Divide, Conquer, and Glue

Divide, Conquer, and Glue

Divide, Conquer, and Glue

Time required by MULT

$T(n)$ = time taken by MULT on two n -bit numbers

What is $T(n)$? What is its growth rate?
Big Question: Is it $\Theta(n^2)$?

Recurrence Relation

$$T(1) = k \quad \text{for some constant } k$$

$$T(n) = 4 T(n/2) + k'n + k'' \quad \text{for constants } k' \text{ and } k''$$

```

MULT(X,Y):
If |X| = |Y| = 1 then return XY
break X into a;b and Y into c;d
return
MULT(a,c) 2^n + (MULT(a,d) + MULT(b,c)) 2^{n/2} + MULT(b,d)
  
```

Let's be concrete and keep it simple

$$T(1) = 1 \quad \text{for some constant } k$$

$$T(n) = 4 T(n/2) + k'n + k'' \quad \text{for constants } k' \text{ and } k''$$

```

MULT(X,Y):
If |X| = |Y| = 1 then return XY
break X into a;b and Y into c;d
return
MULT(a,c) 2^n + (MULT(a,d) + MULT(b,c)) 2^{n/2} + MULT(b,d)
  
```

Let's be concrete and keep it simple

$$T(1) = 1$$

$$T(n) = 4 T(n/2) + n$$

(Notice that $T(n)$ is inductively defined only for positive powers of 2.)

What is the growth rate of $T(n)$?

Technique 1: Guess and Verify

Guess: $G(n) = 2n^2 - n$

Verify: $G(1) = 1$ and $G(n) = 4 G(n/2) + n$

$$\begin{aligned}
 & 4 [2(n/2)^2 - n/2] + n \\
 = & 2n^2 - 2n + n \\
 = & 2n^2 - n \\
 = & G(n)
 \end{aligned}$$

Technique 1: Guess and Verify

Guess: $G(n) = 2n^2 - n$

Verify: $G(1) = 1$ and $G(n) = 4 G(n/2) + n$

Similarly: $T(1) = 1$ and $T(n) = 4 T(n/2) + n$

So $T(n) = G(n) = \Theta(n^2)$

Technique 2: Guess Form and Calculate Coefficients

Guess: $T(n) = an^2 + bn + c$ for some a, b, c

Calculate: $T(1) = 1 \Rightarrow a + b + c = 1$

$$\begin{aligned} T(n) &= 4 T(n/2) + n \\ \Rightarrow an^2 + bn + c &= 4 [a(n/2)^2 + b(n/2) + c] + n \\ &= an^2 + 2bn + 4c + n \end{aligned}$$

$$\Rightarrow (b+1)n + 3c = 0$$

$$\text{Therefore: } b=-1 \quad c=0 \quad a=2$$

Technique 3: Labeled Tree Representation

Definition:
Labeled Tree

A tree node-labeled by S is a tree $T = \langle V, E \rangle$ with an associated function
Label: V to S

From Lecture #2

Technique 3: Labeled Tree Representation

$$T(n) = n + 4 T(n/2)$$

$$T(1) = 1$$

Node labels: time not spent conquering

$$T(n) = n + 4 T(n/2)$$

$$T(1) = 1$$

Divide and Conquer MULT: $\Theta(n^2)$ time
 Grade School Multiplication: $\Theta(n^2)$ time

In retrospect, it is obvious that the kissing number for Divide and Conquer MULT is n^2 , since the leaves are in correspondence with the kisses.

MULT revisited

MULT(X,Y):

If $|X| = |Y| = 1$ then return XY

break X into a;b and Y into c;d

return

MULT(a,c) $2^n + (\text{MULT}(a,d) + \text{MULT}(b,c)) 2^{n/2} + \text{MULT}(b,d)$

MULT calls itself 4 times.
 Can you see a way to reduce the number of calls?

Gauss' optimization

Input: a,b,c,d
 Output: ac-bd, ad+bc

$(a+bi)(c+di) =$
 $[ac - bd] + [ad + bc] i$

$X_1 = a + b$

$X_2 = c + d$

$X_3 = X_1 X_2 = ac + ad + bc + bd$

$X_4 = ac$

$X_5 = bd$

$X_6 = X_4 - X_5 = ac - bd$

$X_7 = X_3 - X_4 - X_5 = bc + ad$

Karatsuba, Anatolii Alexeevich (1937-)

Sometime in the late 1950's Karatsuba had formulated the first algorithm to break the kissing barrier!

Gaussified MULT (Karatsuba 1962)

MULT(X,Y):

If $|X| = |Y| = 1$ then return XY

break X into a;b and Y into c;d

$e = \text{MULT}(a,c)$ and $f = \text{MULT}(b,d)$

return

$e 2^n + (\text{MULT}(a+c,b+d) - e - f) 2^{n/2} + f$

$T(n) = 3 T(n/2) + n$

Actually: $T(n) = 2 T(n/2) + T(n/2 + 1) + kn$

$$1 + X^1 + X^2 + X^3 + \dots + X^{n-1} + X^n = \frac{X^{n+1} - 1}{X - 1}$$

The Geometric Series

Substituting into our formula....

$$1 + X^1 + X^2 + X^3 + \dots + X^{k-1} + X^k = \frac{X^{k+1} - 1}{X - 1}$$

We have: $X = 3/2$ $k = \log_2 n$

$$\frac{(3/2) \times (3/2)^{\log_2 n} - 1}{\frac{1}{2}} = 3 \times (3^{\log_2 n} / 2^{\log_2 n}) - 2$$

$$= 3 \times (3^{\log_2 n} / n) - 2$$

$$= \frac{3 n^{(\log_2 3)} - 2}{n}$$

Dramatic improvement for large n

$$T(n) = 3n^{\log_2 3} - 2n$$

$$= \Theta(n^{\log_2 3})$$

$$= \Theta(n^{1.58...})$$

A huge savings over $\Theta(n^2)$ when n gets large.
