Assignment 4:
Evaluation in the E Machine

15-312: Foundations of Programming Languages
Daniel Spoonhower (spoons@cs.cmu.edu)

Out: Thursday, September 25, 2003
Due: Thursday, October 9, 2003 (11:59 pm)

100 points total + 40 points extra credit

1 Introduction

To begin this assignment, you will first extend the parser from Assignment 2. You will then implement an E machine evaluator (as shown in lecture) that supports unit, pairs, functions, recursive expressions, and named exceptions.

In the assignment directory you’ll find several files with support code; you will only need to fill in the missing code in parse.sml, typing.sml, and e-mach.sml.

You will rarely, if ever, need to write long or complicated functions to complete this assignment. Therefore, you should strive for elegance. Your solution will be graded primarily on correctness, but if your code does not correctly handle one or more cases, we will inspect your code and attempt to give you some credit for the understanding it reflects. You will also have the opportunity to reuse your solution to this assignment in future assignments. In each of the latter situations, it is to your benefit to write clean, legible code.

Before you begin, you may wish to (re)read the provided code (especially the signatures) to gain an understanding of the setup. All of the necessary SML files are listed in the sources.cm file, and you can build the project in SML/NJ by typing CM.make().

Note: In the .sml files, significant changes from Assignment 2 are indicated as shown below.

(* new asst4 code: *)

... (* end asst4 code *)

2 Parser and Concrete Syntax

The concrete syntax for this assignment is shown in Figure 1 (though we will continue to use abstract syntax for types to improve readability). The grammar differs from Assignment 2 as follows:

- MinML now includes unit and pair (product) types $\tau_1 \times \tau_2$. The type constructor $\times$ has higher precedence than $\rightarrow$, just as in SML. Unlike SML, however, there are only pairs, not arbitrary $n$-tuples. For example, int $\times$ int $\times$ int is not syntactically correct; you have to write either
(int * int) * int or int * (int * int). (Since there’s no obvious associativity, we require parentheses.)

- We have also added `exn`, the type of exceptions.

- The remaining changes are all to the syntactic category `FactorA`. We will show examples of the new constructs below.

Finally, the lexer now supports SML-style comments; you may now annotate your test programs with text that will be ignored by the typechecker and evaluator.

Here are some new examples along with their translation into MinML abstract syntax (type `MinML.exp`).

<table>
<thead>
<tr>
<th>Concrete Syntax</th>
<th>Lexer Tokens</th>
<th>Abstract Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1,2)</td>
<td>LPAREN NUMBER(1) COMMA NUMBER(2) RPAREN</td>
<td>Pair(Int(1), Int(2))</td>
</tr>
<tr>
<td><code>fst x</code></td>
<td>FST VAR(&quot;x&quot;)</td>
<td>Fst(Var(&quot;x&quot;))</td>
</tr>
<tr>
<td><code>exception x in () end</code></td>
<td>EXCEPTION VAR(&quot;x&quot;) IN LPAREN RPAREN END</td>
<td>Exception(Var(&quot;x&quot;), Unit)</td>
</tr>
<tr>
<td><code>raise[int*int] ex</code></td>
<td>RAISE LBRACKET INT TIMES INT RBRACKET VAR(&quot;ex&quot;)</td>
<td>Raise(PAIR(INT,INT), Var(&quot;ex&quot;))</td>
</tr>
</tbody>
</table>

Just as in Assignment 2, abstract syntax groups binders with their scope, in the style of higher-order abstract syntax, and variables are represented via their name as a string.

In this assignment, MinML already supports a limited form of evaluation, in particular, the evaluation of arithmetic expressions. You may experiment with the current parser, typechecker and evaluator by typing `Top.loop_eval ();` or `Top.file_eval "test_file.mml";` at the SML/NJ prompt.

Task: Parsing (10 points)
Extend the implementation in `parse.sml` to handle all the new expression forms: unit, pairs, `fst`, `snd`, `exception`, `raise`, and `try`. **Hint:** Focus your attention on `parse_factora`. The new type constructors `∗` and `exn` have been implemented for you.

3 De Bruijn Translation

De Bruijn translation of the new constructs has been implemented for you. Except for the parser (which emits an abstract syntax tree in named form), all of your code will operate on programs in de Bruijn form.
Figure 1: MinML concrete syntax.
4 Unit and Pairs

In this task you will add unit and pairs to MinML. The typing rules shown below should be familiar. Unlike Assignment 2, the dynamic semantics below describes *eager* lists; \( \text{pair}(v_1, v_2) \) is a value only if both \( v_1 \) and \( v_2 \) are values.

Notice the four different forms of frames that appear in the evaluation rules below. You will find four corresponding constructors \( \text{FPair1}, \text{FPair2}, \text{FFst}, \text{FSnd} \) in the frame datatype in \( \text{e-mach.sml} \). These constructors have already been given the proper parameter types for you to use in your implementation.

\[
\begin{align*}
\Gamma &\vdash \text{unitel} : \text{unit} & \Gamma &\vdash \text{pair}(e_1, e_2) : \tau_1 \times \tau_2 & \Gamma &\vdash e : \tau_1 \times \tau_2 \\
\end{align*}
\]

\[
\begin{align*}
k | \eta > \text{unitel} & \mapsto_e k | \eta < \text{unitel} \\
k | \eta > \text{pair}(e_1, e_2) & \mapsto_e k \triangleright \text{pair}(\Box, e_2) | \eta > e_1 \\
k \triangleright \text{pair}(\Box, e_2) | \eta < v_1 & \mapsto_e k \triangleright \text{pair}(v_1, \Box) | \eta > e_2 \\
k \triangleright \text{pair}(v_1, \Box) | \eta < v_2 & \mapsto_e k | \eta < \text{pair}(v_1, v_2) \\
k | \eta > \text{fst}(e) & \mapsto_e k \triangleright \text{fst}(\Box) | \eta > e \\
k \triangleright \text{fst}(\Box) | \eta < \text{pair}(v_1, v_2) & \mapsto_e k | \eta < v_1 \\
k | \eta > \text{snd}(e) & \mapsto_e k \triangleright \text{snd}(\Box) | \eta > e \\
k \triangleright \text{snd}(\Box) | \eta < \text{pair}(v_1, v_2) & \mapsto_e k | \eta < v_2 \\
\end{align*}
\]

**Task: Unit and Pairs: Typing and Evaluation (15 points)**

Following the rules above, extend (1) the typing function in \( \text{typing.sml} \) and (2) the step function in \( \text{e-mach.sml} \) to handle unit and pairs (including \( \text{fst} \) and \( \text{snd} \)). You may start with your own solution to Assignment 2 or the version of \( \text{typing.sml} \) we have provided.

Note that at this stage of your implementation, your evaluator will remain limited in the scope of programs it can handle. Use the example file \( \text{pairs.mml} \) (or equivalent) and the function \( \text{Top.file_step} \) to see the intermediate steps taken by your evaluator.

5 Closures and Suspensions

The E machine has no intrinsic notion of substitution; instead, it explicitly maintains a mapping from variable bindings to the expressions they stand for. In lecture and in the rules below, we assumed that each variable is bound at most once in every environment. Your implementation, however, need not be concerned with the uniqueness of bindings, since it will operate on expressions in de Bruijn form.

Remember that in the semantics of the E machine, function expressions are *not* values. Instead, we bind the current environment together with an expression \( \text{fn} (\tau, x. e) \) to form a closure. Similarly, you should also include copy of the current environment when binding recursive expressions into the environment.
For this part of the assignment, you should bind the entire current environment into each closure (as opposed to bindings for only the free variables of \( x.e \) as discussed in lecture) as shown in the rules below.

\[
\begin{align*}
\text{Task: Closures and Suspensions: Evaluation (25 points)} \\
&\text{Following the rules above, (1) modify the frame and value datatypes in e-mach.sml as necessary and (2) extend the step function to handle \( \text{fn} \), \( \text{let} \), \( \text{rec} \), and \( \text{apply} \).} \\
&\text{Note that the functions \( \text{Top.loop_eval} \) and \( \text{Top.file_eval} \) will not print the result of a program that evaluates to an function expression \( \text{fn}(\tau, x.e) \) as they are currently implemented. You may modify the implementation to do so or use \( \text{Top.loop_step} \) and \( \text{Top.file_step} \) to see the result of such an evaluation.} \\
&\text{Task: Efficient Closures: Evaluation (EXTRA CREDIT, 15 points)} \\
&\text{The rules above bind all variables found in the current environment into a closure. As we discussed in lecture, type safety requires only those variables that are free in the enclosed expression to be bound in the closure. Modify your implementation so that the minimum number of variables are bound each closure. (Think carefully about about how our use of de Bruijn indices would affect this optimization.) If you undertake this task, you may hand in a separate file smart-e-mach.sml rather than modifying your previous implementation.} \\
&\text{6 Named Exceptions} \\
&\text{Task: Named Exceptions: Typing (5 points)} \\
&\text{Following the rules above, extend the typing function in typing.sml to handle the exception, raise, and try constructs.}
\end{align*}
\]
Task: Named Exceptions: Transition Rules (15 points)
Formulate all the \(E\) machine transition rules needed for exception, raise, and try. As in lecture, use the notation
\[ k \mid \eta \ll v \]
to denote a state in which the exception \(v\) has been raised with stack \(k\) and environment \(\eta\). Your rules (and your implementation) should allow exceptions to escape. Furthermore, you should describe an evaluation in which the second expression \(e_2\) of try is always evaluated (and therefore \(e_2\) should be evaluated before \(e_1\).)
Submit the rules on paper or as a file exn-rules.txt or exn-rules.ps.

Task: Named Exceptions: Implementation (30 points)
Implement your rules in e-mach.sml. You will need to figure out a suitable representation for exceptions and change the definition of the \(\text{VExn}\) constructor accordingly.

7 Lazy Evaluation
Following your work in Assignment 2, in this extra credit task, you will add a construct for lazy evaluation to MinML. The concrete syntax should be of the form \(\text{delay } e\), and we will use the abstract syntax \(\text{delay}(e)\). The semantics of \(\text{delay}(e)\) is that the evaluation of \(e\) is suspended, and a suspension is returned as a value. The suspension is opened and evaluated as late as possible. For example, a suspension of pair type should only be opened when it appears as an argument to \(\text{fst}\) or \(\text{snd}\); a suspension of function type should only be opened when it appears on the left side of an application. Similarly for \(\text{try}\) and \(\text{raise}\).

Task: Lazy Evaluation: Parsing, Typing and Evaluation (EXTRA CREDIT, 25 points)
Extend the lexer and parser to accept this new construct. Write down the static and dynamic semantics and implement them in typing.sml and e-mach.sml. Hand in your typing and evaluation rules on paper or as a file lazy-rules.txt or lazy-rules.ps. Partial credit will be given if you correctly complete one or more of these subtasks.

8 Test Cases

<table>
<thead>
<tr>
<th>Filename</th>
<th>Expected Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pairs.mml</td>
<td>(((3, (true, 5)), (), ((int) * ((bool) * (int)) * (unit)))</td>
<td>Simple test of pair and unit</td>
</tr>
<tr>
<td>primops.mml</td>
<td>true : bool</td>
<td>Simple test of arithmetic</td>
</tr>
<tr>
<td>uncaught.mml</td>
<td>raises Uncaught</td>
<td>Raises an uncaught exception</td>
</tr>
</tbody>
</table>

You are encouraged to submit test cases to us. We will test each submission against a subset of the submitted test cases, in addition to our own. So, even though you will not receive any points specifically for handing in test cases, it’s in your interest to send us tests that your code handles correctly. See below for submission instructions.
9 Hand-in Instructions

Turn in the files parse.sml, typing.sml, and e-mach.sml (and any additional files you modify in the extra credit tasks) by copying them to your handin directory

/afs/andrew/scs/cs/15-312/students/Andrew user ID/asst4/

by 11:59 pm on the due date. Immediately after the deadline, we will run a script to sweep through all the handin directories and copy your files elsewhere. We will also sweep 24, 48, and 72 hours after the deadline, for anyone using late days on this assignment.

Turn in non-programming questions as text or postscript files in the handin directory. Or, if you wish, you may turn in answers on paper, due in WeH 5119 by 11:59 pm on the due date. If you are using late days, paper handin is by arrangement only (send mail and we’ll figure something out).

Also, please turn in any test cases you’d like us to use by copying them to your handin directory. To ensure that we notice the files, make sure they have the suffix .mml.

For more information on handing in code, refer to

http://www.cs.cmu.edu/~fp/courses/312/assignments.html
