

# Synchronization: Advanced

15-213: Introduction to Computer Systems  
26<sup>th</sup> Lecture, Aug. 2, 2011

**Instructors:**

Gregory Kesden

# Exam 2

# Today

- **Producer-consumer problem**
- Readers-writers problem
- Thread safety
- Races
- Deadlocks

# Using Semaphores to Schedule Access to Shared Resources

- **Basic idea: Thread uses a semaphore operation to notify another thread that some condition has become true**
  - Use counting semaphores to keep track of resource state.
  - Use binary semaphores to notify other threads.
- **Two classic examples:**
  - The Producer-Consumer Problem
  - The Readers-Writers Problem

# Producer-Consumer Problem

## ■ Common synchronization pattern:

- Producer waits for empty *slot*, inserts item in buffer, and notifies consumer
- Consumer waits for *item*, removes it from buffer, and notifies producer

## ■ Examples

- Multimedia processing:
  - Producer creates MPEG video frames, consumer renders them
- Event-driven graphical user interfaces
  - Producer detects mouse clicks, mouse movements, and keyboard hits and inserts corresponding events in buffer
  - Consumer retrieves events from buffer and paints the display

# Producer-Consumer on 1-element Buffer

```
#include "csapp.h"

#define NITERS 5

void *producer(void *arg);
void *consumer(void *arg);

struct {
    int buf; /* shared var */
    sem_t full; /* sems */
    sem_t empty;
} shared;
```

```
int main() {
    pthread_t tid_producer;
    pthread_t tid_consumer;

    /* Initialize the semaphores */
    Sem_init(&shared.empty, 0, 1);
    Sem_init(&shared.full, 0, 0);

    /* Create threads and wait */
    Pthread_create(&tid_producer, NULL,
                  producer, NULL);
    Pthread_create(&tid_consumer, NULL,
                  consumer, NULL);

    Pthread_join(tid_producer, NULL);
    Pthread_join(tid_consumer, NULL);

    exit(0);
}
```

# Producer-Consumer on 1-element Buffer

Initially: `empty==1, full==0`

## Producer Thread

```
void *producer(void *arg) {
    int i, item;

    for (i=0; i<NITERS; i++) {
        /* Produce item */
        item = i;
        printf("produced %d\n",
            item);

        /* Write item to buf */
        P(&shared.empty);
        shared.buf = item;
        V(&shared.full);
    }
    return NULL;
}
```

## Consumer Thread

```
void *consumer(void *arg) {
    int i, item;

    for (i=0; i<NITERS; i++) {
        /* Read item from buf */
        P(&shared.full);
        item = shared.buf;
        V(&shared.empty);

        /* Consume item */
        printf("consumed %d\n", item);
    }
    return NULL;
}
```

# Producer-Consumer on an $n$ -element Buffer

- **Requires a mutex and two counting semaphores:**
  - `mutex`: enforces mutually exclusive access to the the buffer
  - `slots`: counts the available slots in the buffer
  - `items`: counts the available items in the buffer
- **Implemented using a shared buffer package called `sbuf`.**

# sbuf Package - Declarations

```
#include "csapp.h"

typedef struct {
    int *buf;           /* Buffer array */
    int n;             /* Maximum number of slots */
    int front;         /* buf[(front+1)%n] is first item */
    int rear;          /* buf[rear%n] is last item */
    sem_t mutex;       /* Protects accesses to buf */
    sem_t slots;        /* Counts available slots */
    sem_t items;        /* Counts available items */
} sbuf_t;

void sbuf_init(sbuf_t *sp, int n);
void sbuf_deinit(sbuf_t *sp);
void sbuf_insert(sbuf_t *sp, int item);
int sbuf_remove(sbuf_t *sp);
```

sbuf.h

# sbuf Package - Implementation

## Initializing and deinitializing a shared buffer:

```
/* Create an empty, bounded, shared FIFO buffer with n slots */
void sbuf_init(sbuf_t *sp, int n)
{
    sp->buf = Calloc(n, sizeof(int));
    sp->n = n; /* Buffer holds max of n items */
    sp->front = sp->rear = 0; /* Empty buffer iff front == rear */
    Sem_init(&sp->mutex, 0, 1); /* Binary semaphore for locking */
    Sem_init(&sp->slots, 0, n); /* Initially, buf has n empty slots */
    Sem_init(&sp->items, 0, 0); /* Initially, buf has zero items */
}

/* Clean up buffer sp */
void sbuf_deinit(sbuf_t *sp)
{
    Free(sp->buf);
}
```

# sbuf Package - Implementation

## Inserting an item into a shared buffer:

```
/* Insert item onto the rear of shared buffer sp */
void sbuf_insert(sbuf_t *sp, int item)
{
    P(&sp->slots);          /* Wait for available slot */
    P(&sp->mutex);          /* Lock the buffer */
    sp->buf[(++sp->rear)%sp->n] = item; /* Insert the item */
    V(&sp->mutex);          /* Unlock the buffer */
    V(&sp->items);          /* Announce available item */
}
```

sbuf.c

# sbuf Package - Implementation

## Removing an item from a shared buffer:

```
/* Remove and return the first item from buffer sp */
int sbuf_remove(sbuf_t *sp)
{
    int item;

    P(&sp->items);                /* Wait for available item */
    P(&sp->mutex);                 /* Lock the buffer */
    item = sp->buf[(++sp->front)% (sp->n)]; /* Remove the item */
    V(&sp->mutex);                /* Unlock the buffer */
    V(&sp->slots);                /* Announce available slot */
    return item;
}
```

sbuf.c

# Today

- Producer-consumer problem
- **Readers-writers problem**
- Thread safety
- Races
- Deadlocks

# Readers-Writers Problem

- **Generalization of the mutual exclusion problem**
- **Problem statement:**
  - *Reader* threads only read the object
  - *Writer* threads modify the object
  - Writers must have exclusive access to the object
  - Unlimited number of readers can access the object
- **Occurs frequently in real systems, e.g.,**
  - Online airline reservation system
  - Multithreaded caching Web proxy

# Variants of Readers-Writers

- ***First readers-writers problem (favors readers)***
  - No reader should be kept waiting unless a writer has already been granted permission to use the object.
  - A reader that arrives after a waiting writer gets priority over the writer.
- ***Second readers-writers problem (favors writers)***
  - Once a writer is ready to write, it performs its write as soon as possible
  - A reader that arrives after a writer must wait, even if the writer is also waiting.
- ***Starvation (where a thread waits indefinitely) is possible in both cases.***

# Solution to First Readers-Writers Problem

## Readers:

```
int readcnt;    /* Initially 0 */
sem_t mutex, w; /* Both initially 1 */

void reader(void)
{
    while (1) {
        P(&mutex);
        readcnt++;
        if (readcnt == 1) /* First in */
            P(&w);
        V(&mutex);

        /* Reading happens here */

        P(&mutex);
        readcnt--;
        if (readcnt == 0) /* Last out */
            V(&w);
        V(&mutex);
    }
}
```

## Writers:

```
void writer(void)
{
    while (1) {
        P(&w);

        /* Writing here */

        V(&w);
    }
}
```

rw1.c

# Case Study: Prethreaded Concurrent Server

# Prethreaded Concurrent Server

```
sbuf_t sbuf; /* Shared buffer of connected descriptors */

int main(int argc, char **argv)
{
    int i, listenfd, connfd, port;
    socklen_t clientlen=sizeof(struct sockaddr_in);
    struct sockaddr_in clientaddr;
    pthread_t tid;

    port = atoi(argv[1]);
    sbuf_init(&sbuf, SBUFSIZE);
    listenfd = Open_listenfd(port);

    for (i = 0; i < NTHREADS; i++) /* Create worker threads */
        Pthread_create(&tid, NULL, thread, NULL);

    while (1) {
        connfd = Accept(listenfd, (SA *) &clientaddr, &clientlen);
        sbuf_insert(&sbuf, connfd); /* Insert connfd in buffer */
    }
}
```

# Prethreaded Concurrent Server

Worker thread routine:

```
void *thread(void *vargp)
{
    Pthread_detach(pthread_self());
    while (1) {
        int connfd = sbuf_remove(&sbuf); /* Remove connfd from
                                         buffer */
        echo_cnt(connfd);                /* Service client */
        Close(connfd);
    }
}
```

echoservt\_pre.c

# Prethreaded Concurrent Server

echo\_cnt initialization routine:

```
static int byte_cnt; /* Byte counter */
static sem_t mutex; /* and the mutex that protects it */

static void init_echo_cnt(void)
{
    Sem_init(&mutex, 0, 1);
    byte_cnt = 0;
}
```

echo\_cnt.c

# Prethreaded Concurrent Server

Worker thread service routine:

```
void echo_cnt(int connfd)
{
    int n;
    char buf[MAXLINE];
    rio_t rio;
    static pthread_once_t once = PTHREAD_ONCE_INIT;

    Pthread_once(&once, init_echo_cnt);
    Rio_readinitb(&rio, connfd);
    while((n = Rio_readlineb(&rio, buf, MAXLINE)) != 0) {
        P(&mutex);
        byte_cnt += n;
        printf("thread %d received %d (%d total) bytes on fd
%d\n",
              (int) pthread_self(), n, byte_cnt, connfd);
        V(&mutex);
        Rio_writen(connfd, buf, n);
    }
}
```

echo\_cnt.c

# Today

- Producer-consumer problem
- Readers-writers problem
- **Thread safety**
- Races
- Deadlocks

# Crucial concept: Thread Safety

- Functions called from a thread must be *thread-safe*
- *Def:* A function is *thread-safe* iff it will always produce correct results when called repeatedly from multiple concurrent threads.
- **Classes of thread-unsafe functions:**
  - Class 1: Functions that do not protect shared variables.
  - Class 2: Functions that keep state across multiple invocations.
  - Class 3: Functions that return a pointer to a static variable.
  - Class 4: Functions that call thread-unsafe functions.

# Thread-Unsafe Functions (Class 1)

- **Failing to protect shared variables**

- Fix: Use  $P$  and  $V$  semaphore operations
- Example: `goodcnt.c`
- Issue: Synchronization operations will slow down code

# Thread-Unsafe Functions (Class 2)

- Relying on persistent state across multiple function invocations
  - Example: Random number generator that relies on static state

```
static unsigned int next = 1;

/* rand: return pseudo-random integer on 0..32767 */
int rand(void)
{
    next = next*1103515245 + 12345;
    return (unsigned int)(next/65536) % 32768;
}

/* srand: set seed for rand() */
void srand(unsigned int seed)
{
    next = seed;
}
```

# Thread-Safe Random Number Generator

- Pass state as part of argument
  - and, thereby, eliminate static state

```
/* rand_r - return pseudo-random integer on 0..32767 */  
  
int rand_r(int *nextp)  
{  
    *nextp = *nextp*1103515245 + 12345;  
    return (unsigned int)(*nextp/65536) % 32768;  
}
```

- Consequence: programmer using `rand_r` must maintain seed

# Thread-Unsafe Functions (Class 3)

- Returning a pointer to a static variable
- **Fix 1. Rewrite function so caller passes address of variable to store result**
  - Requires changes in caller and callee
- **Fix 2. Lock-and-copy**
  - Requires simple changes in caller (and none in callee)
  - However, caller must free memory.

```
/* lock-and-copy version */
char *ctime_ts(const time_t *timep,
               char *privatep)
{
    char *sharedp;

    P(&mutex);
    sharedp = ctime(timep);
    strcpy(privatep, sharedp);
    V(&mutex);
    return privatep;
}
```

**Warning:** Some functions like `gethostbyname` require a *deep copy*. Use reentrant `gethostbyname_r` version instead.

# Thread-Unsafe Functions (Class 4)

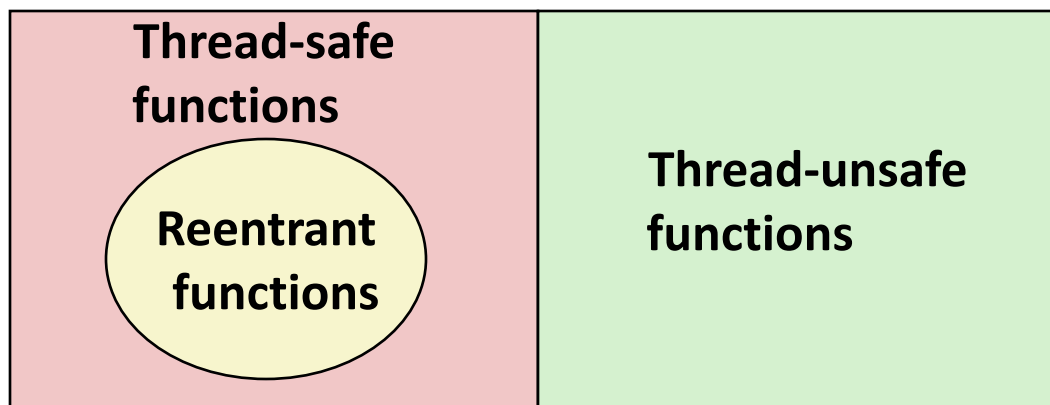

## ■ Calling thread-unsafe functions

- Calling one thread-unsafe function makes the entire function that calls it thread-unsafe
- Fix: Modify the function so it calls only thread-safe functions 😊

# Reentrant Functions

- Def: A function is *reentrant* iff it accesses no shared variables when called by multiple threads.
  - Important subset of thread-safe functions.
    - Require no synchronization operations.
    - Only way to make a Class 2 function thread-safe is to make it reentrant (e.g., `rand_r`)

## All functions

# Thread-Safe Library Functions

- All functions in the Standard C Library (at the back of your K&R text) are thread-safe
  - Examples: `malloc`, `free`, `printf`, `scanf`
- Most Unix system calls are thread-safe, with a few exceptions:

Thread-unsafe function	Class	Reentrant version
<code>asctime</code>	3	<code>asctime_r</code>
<code>ctime</code>	3	<code>ctime_r</code>
<code>gethostbyaddr</code>	3	<code>gethostbyaddr_r</code>
<code>gethostbyname</code>	3	<code>gethostbyname_r</code>
<code>inet_ntoa</code>	3	(none)
<code>localtime</code>	3	<code>localtime_r</code>
<code>rand</code>	2	<code>rand_r</code>

# Today

- Producer-consumer problem
- Readers-writers problem
- Thread safety
- **Races**
- Deadlocks

# One Worry: Races

- A *race* occurs when correctness of the program depends on one thread reaching point x before another thread reaches point y

```
/* a threaded program with a race */
int main() {
    pthread_t tid[N];
    int i;
    for (i = 0; i < N; i++)
        Pthread_create(&tid[i], NULL, thread, &i);
    for (i = 0; i < N; i++)
        Pthread_join(tid[i], NULL);
    exit(0);
}

/* thread routine */
void *thread(void *vargp) {
    int myid = *((int *)vargp);
    printf("Hello from thread %d\n", myid);
    return NULL;
}
```

# Race Elimination

- Make sure don't have unintended sharing of state

```
/* a threaded program without the race */
int main() {
    pthread_t tid[N];
    int i;
    for (i = 0; i < N; i++) {
        int *valp = malloc(sizeof(int));
        *valp = i;
        Pthread_create(&tid[i], NULL, thread, valp);
    }
    for (i = 0; i < N; i++)
        Pthread_join(tid[i], NULL);
    exit(0);
}

/* thread routine */
void *thread(void *vargp) {
    int myid = *((int *)vargp);
    free(vargp);
    printf("Hello from thread %d\n", myid);
    return NULL;
}
```

norace.c

# Today

- Producer-consumer problem
- Readers-writers problem
- Thread safety
- Races
- **Deadlocks**

# Another Worry: Deadlock

- Def: A process is *deadlocked* iff it is waiting for a condition that will never be true.
- Typical Scenario
  - Processes 1 and 2 needs two resources (A and B) to proceed
  - Process 1 acquires A, waits for B
  - Process 2 acquires B, waits for A
  - Both will wait forever!

# Deadlocking With Semaphores

```

int main()
{
    pthread_t tid[2];
    Sem_init(&mutex[0], 0, 1);  /* mutex[0] = 1 */
    Sem_init(&mutex[1], 0, 1);  /* mutex[1] = 1 */
    Pthread_create(&tid[0], NULL, count, (void*) 0);
    Pthread_create(&tid[1], NULL, count, (void*) 1);
    Pthread_join(tid[0], NULL);
    Pthread_join(tid[1], NULL);
    printf("cnt=%d\n", cnt);
    exit(0);
}

```

```

void *count(void *vargp)
{
    int i;
    int id = (int) vargp;
    for (i = 0; i < NITERS; i++) {
        P(&mutex[id]); P(&mutex[1-id]);
        cnt++;
        V(&mutex[id]); V(&mutex[1-id]);
    }
    return NULL;
}

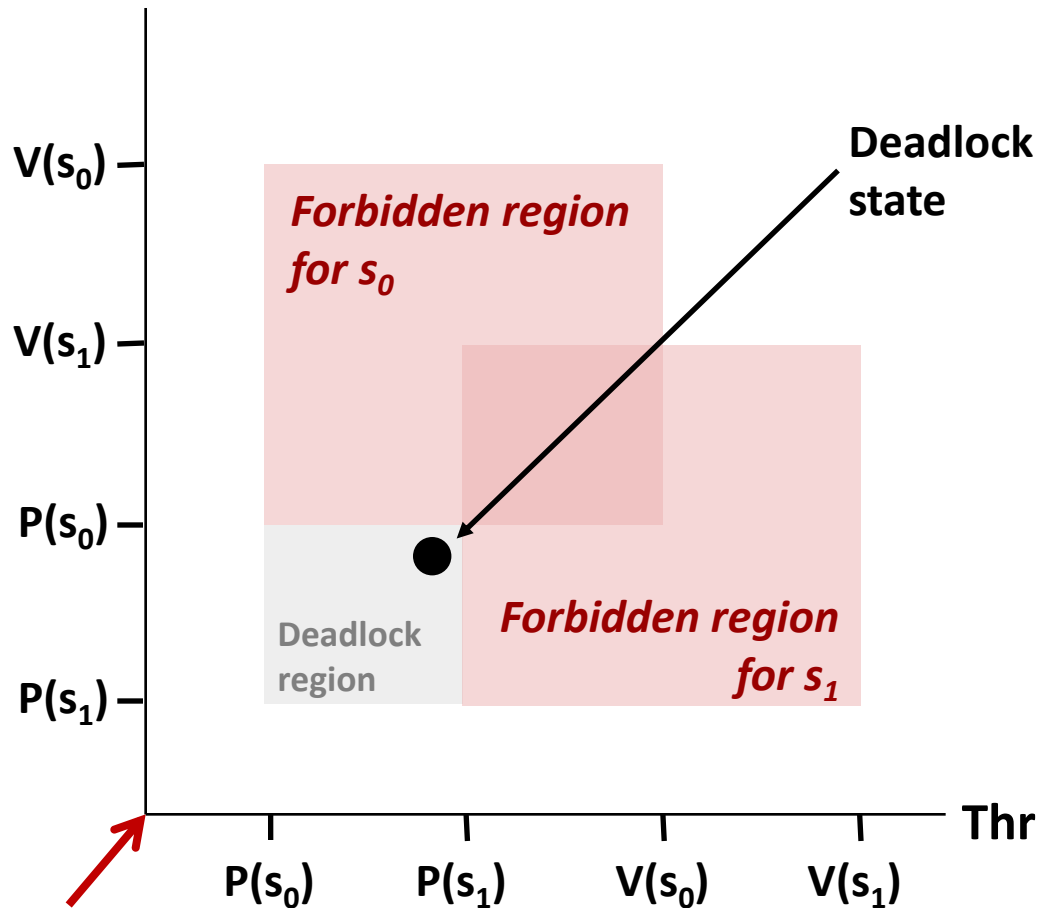

```

Tid[0]:  
P(s<sub>0</sub>);  
P(s<sub>1</sub>);  
cnt++;  
V(s<sub>0</sub>);  
V(s<sub>1</sub>);

Tid[1]:  
P(s<sub>1</sub>);  
P(s<sub>0</sub>);  
cnt++;  
V(s<sub>1</sub>);  
V(s<sub>0</sub>);

# Deadlock Visualized in Progress Graph

Thread 2

Locking introduces the potential for **deadlock**: waiting for a condition that will never be true

Any trajectory that enters the **deadlock region** will eventually reach the **deadlock state**, waiting for either  $S_0$  or  $S_1$  to become nonzero

Other trajectories luck out and skirt the deadlock region

Thread 1 Unfortunate fact: deadlock is often nondeterministic

# Avoiding Deadlock

*Acquire shared resources in same order*

```
int main()
{
    pthread_t tid[2];
    Sem_init(&mutex[0], 0, 1); /* mutex[0] = 1 */
    Sem_init(&mutex[1], 0, 1); /* mutex[1] = 1 */
    Pthread_create(&tid[0], NULL, count, (void*) 0);
    Pthread_create(&tid[1], NULL, count, (void*) 1);
    Pthread_join(tid[0], NULL);
    Pthread_join(tid[1], NULL);
    printf("cnt=%d\n", cnt);
    exit(0);
}
```

```
void *count(void *vargp)
{
    int i;
    int id = (int) vargp;
    for (i = 0; i < NITERS; i++) {
        P(&mutex[0]); P(&mutex[1]);
        cnt++;
        V(&mutex[id]); V(&mutex[1-id]);
    }
    return NULL;
}
```

Tid[0]:  
P(s0);  
P(s1);  
cnt++;  
V(s0);  
V(s1);

Tid[1]:  
P(s0);  
P(s1);  
cnt++;  
V(s1);  
V(s0);

# Avoided Deadlock in Progress Graph

Thread 2

No way for trajectory to get stuck

Processes acquire locks in same order

Order in which locks released immaterial

$s_0 = s_1 = 1$

# Threads Summary

- **Threads provide another mechanism for writing concurrent programs**
- **Threads are growing in popularity**
  - Somewhat cheaper than processes
  - Easy to share data between threads
- **However, the ease of sharing has a cost:**
  - Easy to introduce subtle synchronization errors
  - Tread carefully with threads!
- **For more info:**
  - D. Butenhof, “Programming with Posix Threads”, Addison-Wesley, 1997
