

Texture and other Mappings

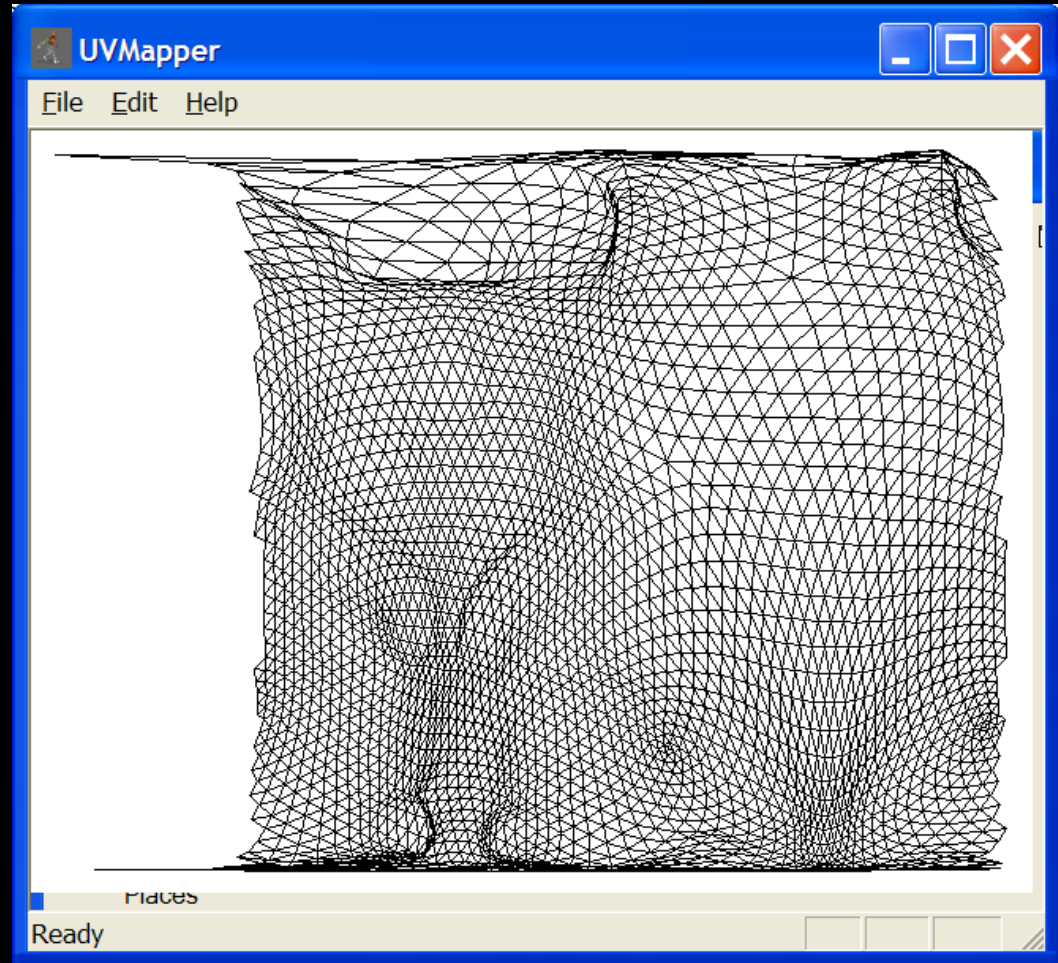

Texture Mapping
Bump Mapping
Displacement Mapping
Environment Mapping

We could specify all texture coordinates by hand...

Tools help us unroll an object to “paint” it

- www.uvmapper.com

Uses for Texture Mapping

Use texture to affect a variety of parameters

- surface color - radiance of each point on surface (Catmull 1974)
- surface reflectance - reflectance coefficients k_d , k_s , or n_{shiny}
- normal vector - bump mapping (Blinn 1978)
- geometry - displacement mapping
- transparency - transparency mapping (clouds) (Gardener 1985)
- light source radiance - environment mapping (Blinn 1978)

Radiance vs. Reflectance Mapping

+

=

Sphere w/ Uniform Diffuse coefficient

Radiance Map

Sphere w/ Radiance Map

Texture specifies (isotropic) radiance for each point on surface

+

=

Sphere w/ Uniform Diffuse coefficient

Reflectance (k_d) Map

Sphere w/ Reflectance Map

Texture specifies diffuse color (k_d coefficients) for each point on surface
- three coefficients, one each for R, G, and B radiance channels

Bump Mapping

- Basic texture mapping paints on to a smooth surface
- How do you make a surface look *rough*?
 - Option 1: model the surface with many small polygons
 - Option 2: perturb the normal vectors before the shading calculation

+

=

Sphere w/Diffuse Texture Map

Bump Map

Sphere w/Diffuse Texture + Bump Map

Bump Mapping

- We can perturb the normal vector without having to make any actual change to the shape.
- This illusion can be seen through—how?

Another Bump Mapping Example

+

Bump Map

=

Displacement Mapping

- Use texture map to displace each point on the surface
 - Texture value gives amount to move in direction normal to surface

- How is this different from bump mapping?

Environment Mapping

Specular reflections that mirror the environment

Environment Mapping

Specular reflections that mirror the environment

Basics of Texture Mapping in OpenGL

```
Glubyte my_texels[512][512][3];
GLuint texID;

glGenTextures(1, &texID);
glBindTexture(GL_TEXTURE_2D, texID);
glTexImage2D(GL_TEXTURE_2D, 0, GL_RGB, 512, 512, 0,
             GL_RGB, GL_UNSIGNED_BYTE, my_texels);
/* level, components, w, h, border, format, type, tarray */

/* assign texture coordinates */
glEnable(GL_TEXTURE_2D);
glBegin(GL_QUAD);
    glTexCoord2f(0.0, 0.0);
    glVertex3f(x1, y1, z1);
    glTexCoord2f(1.0, 0.0);
    glVertex3f(x2, y2, z2);
    glTexCoord2f(1.0, 1.0);
    glVertex3f(x3, y3, z3);
    glTexCoord2f(0.0, 1.0);
    glVertex3f(x4, y4, z4);
glEnd();
glDisable(GL_TEXTURE_2D);
```

Grungy details we've ignored

- Specify s or t out of range? Use `GL_TEXTURE_WRAP` in `glTexParameter` because many textures are carefully designed to repeat

Figure 5.6. Image texture repeat, mirror, clamp, and border functions in action.

- Aliasing? Mapping doesn't send you to the center of a texel. Can average nearest 2x2 texels using `GL_LINEAR`

- Mipmapping: use textures of varying resolutions. 64x64 becomes 32x32, 16x16, 8x8, 4x4, 2x2 and 1x1 arrays with `gluBuild2Dmipmaps`

Texture Generation

Photographs

Drawings

Procedural methods (2D or 3D)

(2D: stripe, wave, and noise patterns)

3D: sculpting in marble and granite)

Procedural Methods

Reaction-Diffusion
Greg Turk, Siggraph '91

Solid Textures

- Have a 3-D array of texture values (e.g., a block of marble)
- In practice the map is often defined procedurally
 - No need to store an entire 3D array of colors
 - Just define a function to generate a color for each 3D point
- The most interesting solid textures are random ones
- Evaluate the texture coordinates in object coordinates - otherwise moving the object changes its texture!
- [Ken Perlin's talk "Making Noise"](#)

From: *An Image Synthesizer*
by Ken Perlin, SIGGRAPH '85

Data Driven Approaches

- Made popular by Efros and Leung, 1999

Practice Problems

How might you create an environment map to capture lighting effects from a real-world outdoor scene? (Think of Paul Debevec's "Rendering with Natural Light" scene shown in class.) Assume only tools that you may have in your home (e.g., a camera).

Practice Problems

When would you choose a displacement map over a bump map?
Which is likely to be more difficult to implement and why?
(Think carefully about the flow of operations in the standard computer graphics pipeline.)

Why do you not get a realistic appearance when using an environment map to render the appearance of a large flat mirror?
What visual artifacts would you expect to see if you tried to do this?
