# Texture and other Mappings

Texture Mapping
Bump Mapping
Displacement Mapping
Environment Mapping

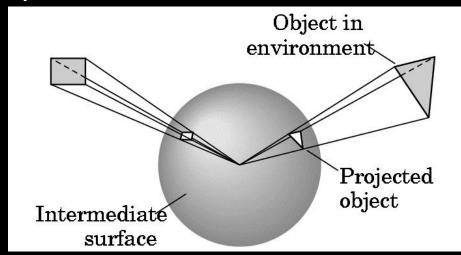

#### **Environment Mapping**

# Specular reflections that mirror the environment

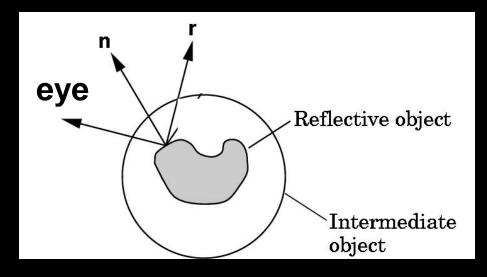

#### **Environment Mapping**

Specular reflections that mirror the environment

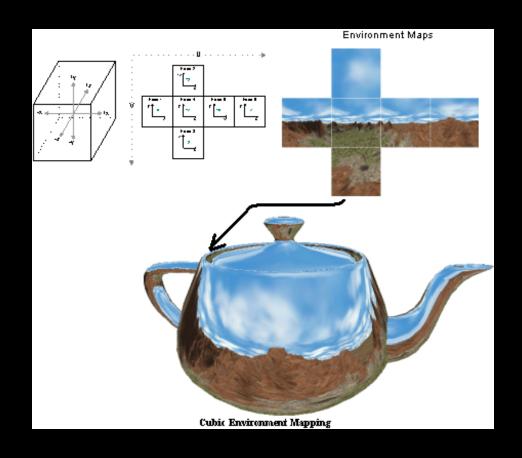

Cube is a natural intermediate object for a room

### **Environment Mapping: Cube Maps**

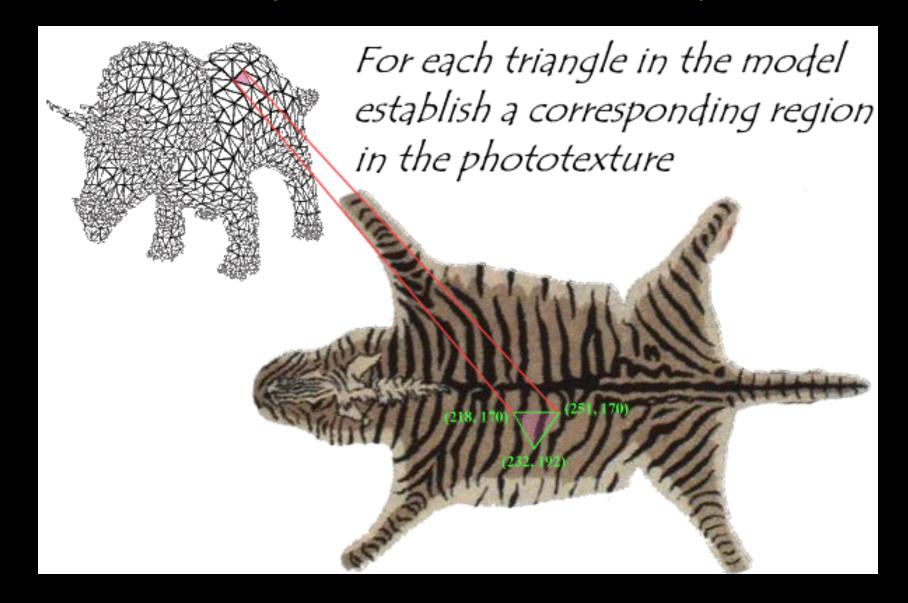

#### Paul Debevec: Image-Based Lighting

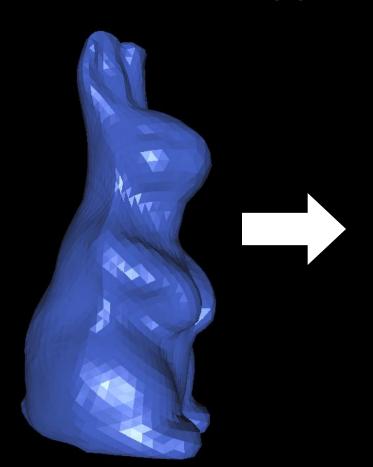

http://www.pauldebevec.com/IBL2003/

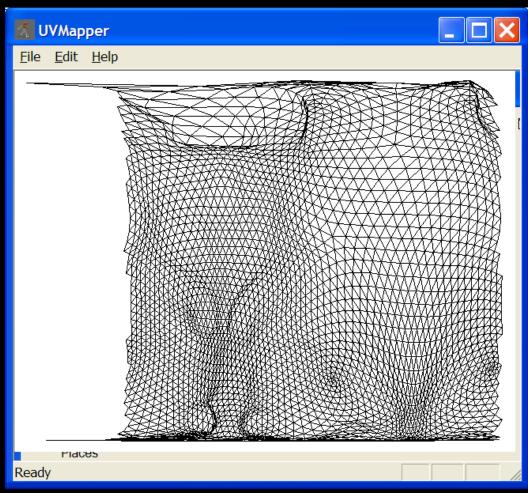

#### We could specify all texture coordinates by hand...

#### Tools help us unroll an object to "paint" it

www.uvmapper.com

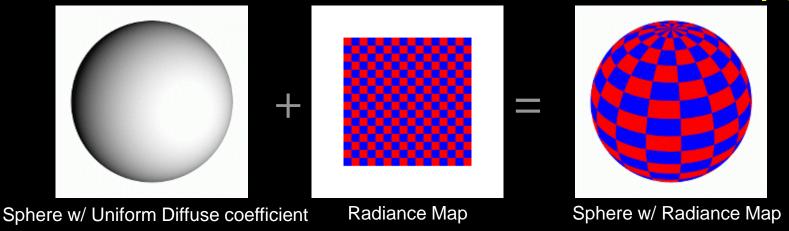

#### **Uses for Texture Mapping**

#### Use texture to affect a variety of parameters

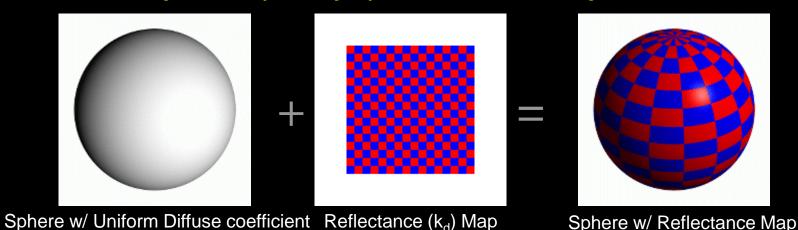

- surface color
- surface reflectance
- normal vector
- geometry
- transparency
- light source radiance

- radiance of each point on surface (Catmull 1974)
- reflectance coefficients  $k_d$ ,  $k_s$ , or  $n_{shiny}$
- bump mapping (Blinn 1978)
- displacement mapping
- transparency mapping (clouds) (Gardener 1985)
- environment mapping (Blinn 1978)

#### Radiance vs. Reflectance Mapping

#### Texture specifies (isotropic) radiance for each point on surface

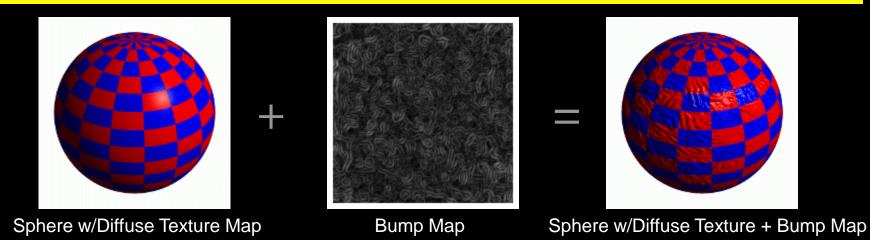

Texture specifies diffuse color ( $k_d$  coefficients) for each point on surface - three coefficients, one each for R, G, and B radiance channels

#### **Bump Mapping**

- Basic texture mapping paints on to a smooth surface
- How do you make a surface look rough?
  - Option 1: model the surface with many small polygons
  - Option 2: perturb the normal vectors before the shading calculation

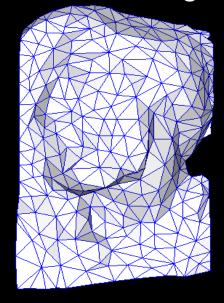

#### **Bump Mapping**

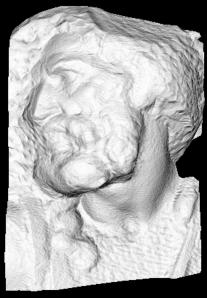

- We can perturb the normal vector without having to make any actual change to the shape.
- This illusion can be seen through—how?

Original model (5M)

Simplified (500)

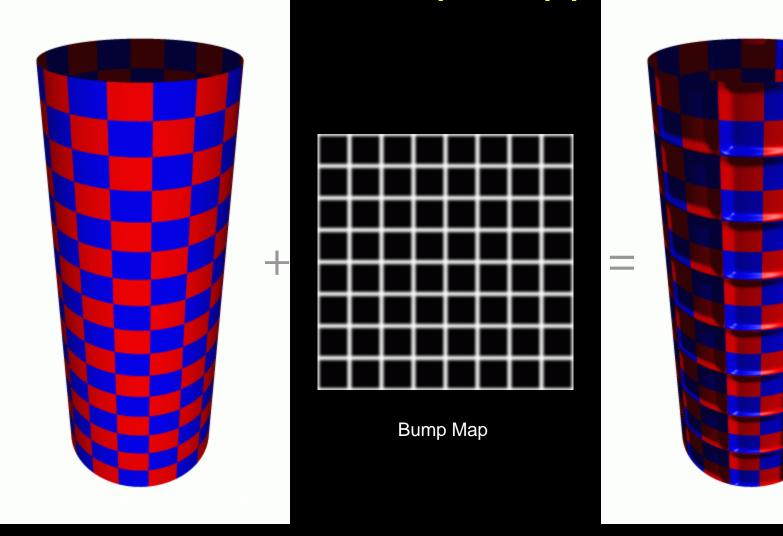

Simple model with bump map

### Bump Mapping

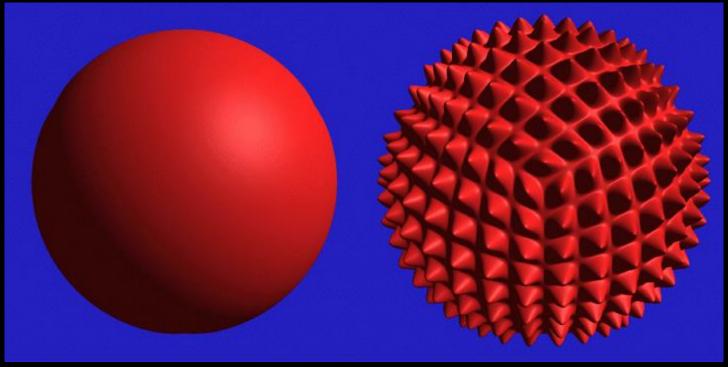

Greg Turk

## Another Bump Mapping Example

#### Displacement Mapping

- Use texture map to displace each point on the surface
  - Texture value gives amount to move in direction normal to surface

How is this different from bump mapping?

#### Basics of Texture Mapping in OpenGL

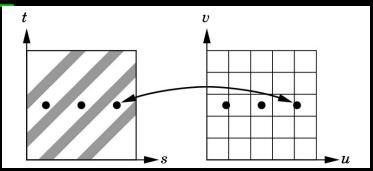

(b)

```
Glubyte my texels[512][512][3];
Gluint texID;
glGenTextures(1, &texID);
glBindTexture(GL TEXTURE 2D, texID);
glTexImage2D(GL TEXTURE 2D, 0, GL RGB, 512, 512, 0,
             GL RGB, GL UNSIGNED BYTE, my texels);
/* level, components, w, h, border, format, type, tarray */
/* assign texture coordinates */
glEnable(GL TEXTURE 2D);
glBegin(GL QUAD);
      glTexCoord2f(0.0, 0.0);
      glVertex3f(x1,y1,z1);
      glTexCoord2f(1.0, 0.0);
      glVertex3f(x2,y2,z2);
      glTexCoord2f(1.0,1.0);
      glVertex3f(x3,y3,z3);
      glTexCoord2f(0.0,1.0);
      glVertex3f(x4,y4,z4);
glEnd();
                                        (a)
glDisable(GL TEXTURE 2D);
```

#### Grungy details we've ignored

Figure 5.6. Image texture repeat, mirror, clamp, and border functions in action.

 Aliasing? Mapping doesn't send you to the center of a texel. Can average nearest 2x2 texels using GL LINEAR

 Mipmapping: use textures of varying resolutions. 64x64 becomes 32x32,16x16,8x8,4x4,2x2 and 1x1 arrays with gluBuild2Dmipmaps

#### **Texture Generation**

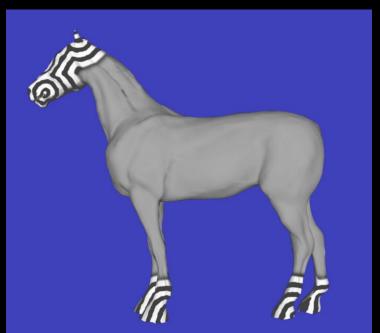

Photographs
Drawings
Procedural methods (2D or 3D)

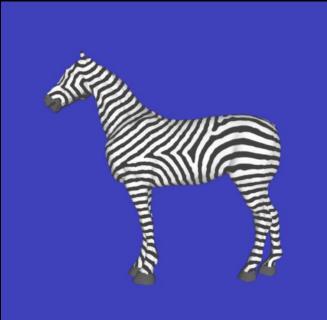

(2D: stripe, wave, and noise patterns

3D: sculpting in marble and granite)

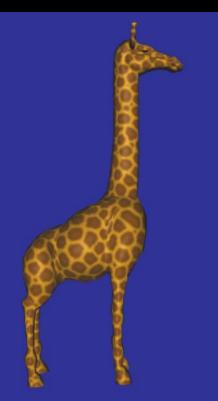

### **Procedural Methods**

Reaction-Diffusion Greg Turk, Siggraph '91

#### Solid Textures

- Have a 3-D array of texture values (e.g., a block of marble)
- In practice the map is often defined procedurally
  - No need to store an entire 3D array of colors
  - Just define a function to generate a color for each 3D point
- The most interesting solid textures are random ones
- Evaluate the texture coordinates in object coordinates - otherwise moving the object changes its texture!

### Data Driven Approaches

Made popular by Efros and Leung, 1999

http://graphics.cs.cmu.edu/people/efros/research/EfrosLeung.html

#### **Practice Problems**

How might you create an environment map to capture lighting effects from a real-world outdoor scene? (Think of Paul Debevec's "Rendering with Natural Light" scene shown in class.) Assume only tools that you may have in your home (e.g., a camera).

#### **Practice Problems**

When would you choose a displacement map over a bump map? Which is likely to be more difficult to implement and why? (Think carefully about the flow of operations in the standard computer graphics pipeline.)

Why do you not get a realistic appearance when using an environment map to render the appearance of a large flat mirror? What visual artifacts would you expect to see if you tried to do this?
