Data Dependence in Loops

Copyright © Seth Goldstein, 2008

Based on slides from Allen&Kennedy

Why Dependence Analysis

- Goal is to find best schedule:
 - Improve memory locality
 - Increase parallelism
 - Decrease scheduling stalls
- Before we schedule we need to know possible legal schedules and impact of schedule on performance

Example to improve locality

```
for i=0 to N
  for j=0 to M
    A[j] = f(A[j]);
```

Is there a better schedule?

Iteration space

Unroll to see deps

```
A[0] = f(A[0])
A[1] = f(A[1])
A[2] = f(A[2])
...
A[N] = f(A[N])
A[0] = f(A[0])
...
```

Example to improve locality

```
for i=0 to N
  for j=0 to M
    A[j] = f(A[j]);
```

Is there a better schedule?

Iteration space

Unroll to see deps

```
A[0] = f(A[0])
A[1] = f(A[1])
A[2] = f(A[2])
...
A[N] = f(A[N])
A[0] = f(A[0])
...
```

```
for j=0 to M
  for i=0 to N
    A[j] = f(A[j]);
```

Transformed iteration space

Old Iteration space

for i=0 to N
 for j=0 to M
 A[j] = f(A[j]);

A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]

New Iteration space

for j=0 to M
 for i=0 to N
 A[j] = f(A[j]);

A[3] ← A[3]	A[3] ← A[3]	A[3] ← A[3]	A[3] ← A[3]
A[2] ← A[2]	A[2] ← A[2]	A[2] ← A[2]	A[2] ← A[2]
A[1] ← A[1]	A[1] ← A[1]	A[1] ← A[1]	A[1] ← A[1]
A[0] ← A[0]	A[0] ← A[0]	A[0] ← A[0]	A[0] ← A[0]

What about ...

for i=0 to N
 for j=0 to M
 A[j] = f(A[j]);
 B[i] = f(B[i]);

Is there a better schedule?

Iteration space

Unroll to see deps

A[0] = f(A[0])
 B[0] = f(B[0])
 A[1] = f(A[1])
 B[0] = f(B[0])
 ...
 A[N] = f(A[N])
 B[0] = f(B[0])
 A[0] = f(A[0])
 B[1] = f(B[1])

A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[3] ← B[3]	B[3] ← B[3]	B[3] ← B[3]	B[3] ← B[3]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[2] ← B[2]	B[2] ← B[2]	B[2] ← B[2]	B[2] ← B[2]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[1] ← B[1]	B[1] ← B[1]	B[1] ← B[1]	B[1] ← B[1]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[0] ← B[0]	B[0] ← B[0]	B[0] ← B[0]	B[0] ← B[0]

What about ...

for i=0 to N
 for j=0 to M
 A[j] = f(A[j]);
 B[i] = f(B[i]);

Is there a better schedule?

Iteration space

Unroll to see deps

A[0] = f(A[0])
 B[0] = f(B[0])
 A[1] = f(A[1])
 B[0] = f(B[0])
 ...
 A[N] = f(A[N])
 B[0] = f(B[0])
 A[0] = f(A[0])
 B[1] = f(B[1])

A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[3] ← B[3]	B[3] ← B[3]	B[3] ← B[3]	B[3] ← B[3]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[2] ← B[2]	B[2] ← B[2]	B[2] ← B[2]	B[2] ← B[2]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[1] ← B[1]	B[1] ← B[1]	B[1] ← B[1]	B[1] ← B[1]
A[0] ← A[0]	A[1] ← A[1]	A[2] ← A[2]	A[3] ← A[3]
B[0] ← B[0]	B[0] ← B[0]	B[0] ← B[0]	B[0] ← B[0]

But, what if ...

for i=0 to N
 for j=1 to M
 A[j] = f(A[j-1]);

Can we reschedule?

Iteration space

Unroll to see deps

A[1] = f(A[0])
 A[2] = f(A[1])
 A[3] = f(A[2])
 ...
 A[N] = f(A[N-1])
 A[1] = f(A[0])
 A[2] = f(A[1])
 A[3] = f(A[2])

A[1] ← A[0]	A[2] ← A[1]	A[3] ← A[2]	A[4] ← A[3]
A[1] ← A[0]	A[2] ← A[1]	A[3] ← A[2]	A[4] ← A[3]
A[1] ← A[0]	A[2] ← A[1]	A[3] ← A[2]	A[4] ← A[3]
A[1] ← A[0]	A[2] ← A[1]	A[3] ← A[2]	A[4] ← A[3]

But, what if ...

for i=0 to N
 for j=1 to M
 $A[j] = f(A[j-1]);$

Can we reschedule?

Iteration space

But, what if ...

for i=0 to N
 for j=1 to M
 $A[j] = f(A[j-1]);$

Can we reschedule?

Iteration space

So, how do we know when/how?

When should we transform a loop?
 What transforms are legal?
 How should we transform the loop.

Dependence information helps with all three questions.

In short,

- Determine all dependence information
- Use dependence information to analyze loop
- Guide transformations using dependence info
- Key is:
 Any transformation* that preserves every dependence in a program preserves the meaning of the program

Data Dependence

- There is a data dependence from statement S_1 to statement S_2 (S_2 depends on S_1) if:
 1. Both statements access the same memory location and at least one of them stores onto it, and
 2. There is a feasible run-time execution path from S_1 to S_2
- We need to characterize the dependence information in terms of the loop iterations involved in the dependence, so we need a way to talk about iterations of a loop.
 - Iteration vector: a label for a loop iteration using the induction variables.
 - Iteration space: the set of all possible iteration vectors for a loop
 - Lexicographic order: The order of the iterations

Iteration Space

Every iteration generates a point in an n-dimensional space, where n is the depth of the loop nest.

```
for (i=0; i<n; i++) {
    ...
}

for (i=0; i<n; i++)
  for (j=0; j<4; j++) {
    ...
  }
```

T. Mowry

Iteration Vectors

- Need to consider the nesting level of a loop
- Nesting level of a loop is equal to one more than the number of loops that enclose it.
- Given a nest of n loops, the iteration vector i of a particular iteration of the innermost loop is a vector of integers that contains the iteration numbers for each of the loops in order of nesting level.
- Thus, the iteration vector is: $\{i_1, i_2, \dots, i_n\}$ where i_k , $1 \leq k \leq n$ represents the iteration number for the loop at nesting level k

Iteration Space

Every iteration generates a point in an n-dimensional space, where n is the depth of the loop nest.

```
for (i=0; i<n; i++) {
    ...
}

for (i=0; i<n; i++)
  for (j=0; j<4; j++) {
    ...
  }
```

T. Mowry

Ordering of Iteration Vectors

- Dan ordering for iteration vectors
- Use an intuitive, **lexicographic order**
- Iteration i precedes iteration j , denoted $i < j$, iff:

1. $i[1:n-1] < j[1:n-1]$, or

2. $i[1:k-1] = j[1:k-1]$ and $i_k < j_k$

$$\begin{pmatrix} i_1 \\ i_2 \\ \dots \\ i_k \\ \dots \\ i_n \end{pmatrix} < \begin{pmatrix} j_1 \\ j_2 \\ \dots \\ j_k \\ \dots \\ j_n \end{pmatrix}$$

Example Iteration Space

```
for i = 0 to N-1
  for j = 0 to N-1
    A[i][j] = B[j][i];
```

- each position represents an iteration

T. Mowry

Visitation Order in Iteration Space

```
for i = 0 to N-1
  for j = 0 to N-1
    A[i][j] = B[j][i];
```

- Note: iteration space is not data space

T. Mowry

Formal Def of Loop Dependence

- There exists a dependence from statements S_1 to statement S_2 in a common nest of loops iff there exist two iteration vectors i and j for the nest, st.
 - (1) (a) $i < j$ or
 - (b) $i = j$ and there is a path from S_1 to S_2 in the body of the loop,
 - (2) statement S_1 accesses memory location M on iteration i and statement S_2 accesses location M on iteration j , and
 - (3) one of these accesses is a write.
- 1a: Loop carried and 1b: Loop independent
- S_1 is source of dependence, S_2 is sink or target of dep

19

Dependence Distance

- Using iteration vectors and def of dependence we can determine the distance of a dependence:
- In n -deep loop nest if
 - S_1 is source in iteration i
 - S_2 is sink in iteration j
- Distance of dependence is represented with a **distance vector: D**
 - Vector of length n , where
 - $d_k = j_k - i_k$

Lecture 6

20

Distance Vector

```
for (i=0; i<n; i++) {
    A[i] = B[i];
    B[i+1] = A[i];
}
```

Distance vector is the difference between the target and source iterations.

$$d = I_t - I_s$$

Exactly the distance of the dependence, i.e.,

$$I_s + d = I_t$$

T. Mowry

Example of Distance Vectors

```
for (i=0; i<n; i++)
    for (j=0; j<m; j++){
        A[i,j] = ;
        = A[i,j];
        B[i,j+1] = ;
        = B[i,j];
        C[i+1,j] = ;
        = C[i,j+1] ;
    }
```

T. Mowry

Example of Distance Vectors

```
for (i=0; i<n; i++)
    for (j=0; j<m; j++){
        A[i,j] = ;
        = A[i,j];
        B[i,j+1] = ;
        = B[i,j];
        C[i+1,j] = ;
        = C[i,j+1] ;
    }
```

A yields: $\begin{pmatrix} 0 \\ 0 \end{pmatrix}$

B yields: $\begin{pmatrix} 0 \\ 1 \end{pmatrix}$

C yields: $\begin{pmatrix} 1 \\ -1 \end{pmatrix}$

Direction Vectors

- Less precise than distance vectors, but often good enough
- In n-deep loop nest if
 - S1 is source in iteration i
 - S2 is sink in iteration j
- Distance vector: F - Vector of length n, where
 - $f_k = j_k - i_k$
- Direction vector also vector of length n, where

$$d_k = \begin{cases} "<" & \text{if } f_k > 0, \text{ or } j_k < i_k \\ "=" & \text{if } f_k = 0, \text{ or } j_k = i_k \\ ">" & \text{if } f_k < 0, \text{ or } j_k > i_k \end{cases}$$

Example of Direction Vectors

```

for (i=0; i<n; i++)
  for (j=0; j<m; j++){
    A[i,j] = ;
    = A[i,j];
    B[i,j+1] = ;
    = B[i,j];
    C[i+1,j] = ;
    = C[i,j+1] ;
  }

```

A _{0,2} = =A _{0,2}	A _{1,2} = =A _{1,2}	A _{2,2} = =A _{2,2}
B _{0,3} = =B _{0,2}	B _{1,3} = =B _{1,2}	B _{2,3} = =B _{2,2}
C _{1,2} = =C _{0,3}	C _{2,2} = =C _{1,3}	C _{3,2} = =C _{2,3}
A _{0,1} = =A _{0,1}	A _{1,1} = =A _{1,1}	A _{2,1} = =A _{2,1}
B _{0,2} = =B _{0,1}	B _{1,2} = =B _{1,1}	B _{2,2} = =B _{2,1}
C _{1,1} = =C _{0,2}	C _{2,1} = =C _{1,2}	C _{3,1} = =C _{2,2}
A _{0,0} = =A _{0,0}	A _{1,0} = =A _{1,0}	A _{2,0} = =A _{2,0}
B _{0,1} = =B _{0,0}	B _{1,1} = =B _{1,0}	B _{2,1} = =B _{2,0}
C _{1,0} = =C _{0,1}	C _{2,0} = =C _{1,1}	C _{3,0} = =C _{2,1}

A yields: $\begin{pmatrix} = \\ = \\ = \end{pmatrix}$ B yields: $\begin{pmatrix} = \\ = \\ < \end{pmatrix}$ C yields: $\begin{pmatrix} < \\ = \\ > \end{pmatrix}$

Direction Vectors

Example:

```

DO I = 1, N
  DO J = 1, M
    DO K = 1, L
      S1      A(I+1, J, K-1) = A(I, J, K) + 10
    ENDDO
  ENDDO
ENDDO

```

- S₁ has a true dependence on itself.
- Distance Vector: (1, 0, -1)
- Direction Vector: (<, =, >)

Note on vectors

- A dependence cannot exist if it has a direction vector whose leftmost non "=" component is not "<" as this would imply that the sink of the dependence occurs before the source.
- Likewise, the first non-zero distance in a distance vector must be positive.

The Key

- Any reordering transformation that preserves every dependence in a program preserves the meaning of the program
- A reordering transformation may change order of execution but does not add or remove statements.

Main Theme

Finding Data Dependences

- Determining whether dependencies exist between two subscripted references to the same array in a loop nest
- Several tests to detect these dependencies

The General Problem

```
DO i1 = L1, U1
  DO i2 = L2, U2
    ...
    DO in = Ln, Un
      S1      A(f1(i1, ..., in), ..., fm(i1, ..., in)) = ...
      S2      ... = A(g1(i1, ..., in), ..., gm(i1, ..., in))
    ENDDO
  ...
ENDDO
ENDDO
```

A dependence exists from S1 to S2 if:

- There exist α and β such that
 - $\alpha < \beta$ (control flow requirement)
 - $f_i(\alpha) = g_i(\beta)$ for all i , $1 \leq i \leq m$ (common access requirement)

Basics: Conservative Testing

- Consider only linear subscript expressions
- Finding integer solutions to system of linear Diophantine Equations is NP-Complete
- Most common approximation is **Conservative Testing**, i.e., See if you can assert "No dependence exists between two subscripted references of the same array"
- Never incorrect, may be less than optimal

Basics: Indices and Subscripts

Index: Index variable for some loop surrounding a pair of references

Subscript: A PAIR of subscript positions in a pair of array references

For Example:

$$A(I, j) = A(I, k) + C$$

<I, I> is the first subscript

<j, k> is the second subscript

Basics: Complexity

A subscript is said to be

- ZIV if it contains no index zero index variable
- SIV if it contains only one index single index variable
- MIV if it contains more than one index multiple index variable

For Example:

$$A(5, I+1, j) = A(1, I, k) + C$$

First subscript is ZIV

Second subscript is SIV

Third subscript is MIV

Basics: Separability

- A subscript is separable if its indices do not occur in other subscripts
- If two different subscripts contain the same index they are coupled

For Example:

$$A(I+1, j) = A(k, j) + C$$

Both subscripts are separable

$$A(I, j, j) = A(I, j, k) + C$$

Second and third subscripts are coupled

Basics: Coupled Subscript Groups

- Why are they important?
Coupling can cause imprecision in dependence testing

```
DO I = 1, 100
S1  A(I+1, I) = B(I) + C
S2  D(I) = A(I, I) * E
ENDDO
```

Dependence Testing: Overview

- Partition subscripts of a pair of array references into separable and coupled groups
- Classify each subscript as ZIV, SIV or MIV
 - Reason for classification is to reduce complexity of the tests.
- For each separable subscript apply single subscript test. Continue until prove independence.
- Deal with coupled groups
- If independent, done
- Otherwise, merge all direction vectors computed in the previous steps into a single set of direction vectors

Step 1: Subscript Partitioning

- Partitions the subscripts into separable and minimal coupled groups
- Notations
 - // S is a set of m subscript pairs S_1, S_2, \dots, S_m each enclosed in n loops with indexes I_1, I_2, \dots, I_n , which is to be partitioned into separable or minimal coupled groups.
 - // P is an output variable, containing the set of partitions
 - // n_p is the number of partitions

Subscript Partitioning Algorithm

```
procedure partition( $S, P, n_p$ )
   $n_p = m$ ;
  for  $i := 1$  to  $m$  do  $P_i = \{S_i\}$ ;
  for  $i := 1$  to  $n$  do begin
     $k := \langle \text{none} \rangle$ 
    for each remaining partition  $P_j$  do
      if there exists  $s \in P_j$  such that  $s$  contains  $I_i$  then
        if  $k = \langle \text{none} \rangle$  then  $k = j$ ;
        else begin  $P_k = P_k \cup P_j$ ; discard  $P_j$ ;  $n_p = n_p - 1$ ; end
    end
  end
end partition
```

Step 2: Classify as ZIV/SIV/MIV

- Easy step
- Just count the number of different indices in a subscript

Step 3: Applying Single Subscript Tests

- ZIV Test
- SIV Test
 - Strong SIV Test
 - Weak SIV Test
 - Weak-zero SIV
 - Weak Crossing SIV
- SIV Tests in Complex Iteration Spaces

ZIV Test

```
DO j = 1, 100
S      A(e1) = A(e2) + B(j)
ENDDO
```

e1, e2 are constants or loop invariant symbols

If $(e1 - e2) \neq 0$ No Dependence exists

Strong SIV Test

- Strong SIV subscripts are of the form
$$\langle ai + c_1, ai + c_2 \rangle$$
- For example the following are strong SIV subscripts
$$\langle i + 1, i \rangle$$
$$\langle 4i + 2, 4i + 4 \rangle$$

Strong SIV Test Example

```
DO k = 1, 100
  DO j = 1, 100
S1      A(j+1,k) = ...
S2      ... = A(j,k) + 32
  ENDDO
ENDDO
```

Strong SIV Test

Geometric View of Strong SIV Tests

Dependence exists if $|d| \leq U - L$

Weak SIV Tests

- Weak SIV subscripts are of the form $\langle a_1 i + c_1, a_2 j + c_2 \rangle$
- For example the following are weak SIV subscripts
 - $\langle i + 1, 5 \rangle$
 - $\langle 2i + 1, i + 5 \rangle$
 - $\langle 2i + 1, -2i \rangle$

Geometric view of weak SIV

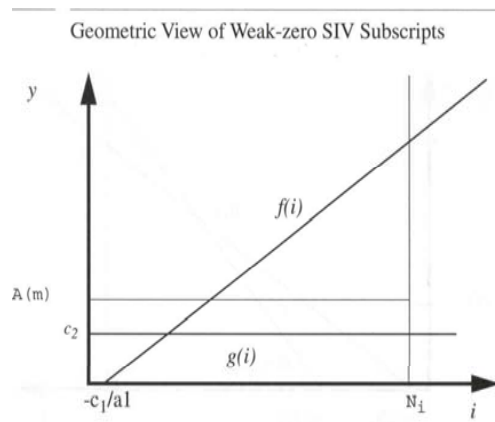

Weak-zero SIV Test

- Special case of Weak SIV where one of the coefficients of the index is zero
- The test consists merely of checking whether the solution is an integer and is within loop bounds

$$i = \frac{c_2 - c_1}{a_1}$$

Weak-zero SIV Test

Weak-zero SIV & Loop Peeling

```

DO i = 1, N
S1   Y(i, N) = Y(1, N) + Y(N, N)
ENDDO
    
```

Can be loop peeled to...

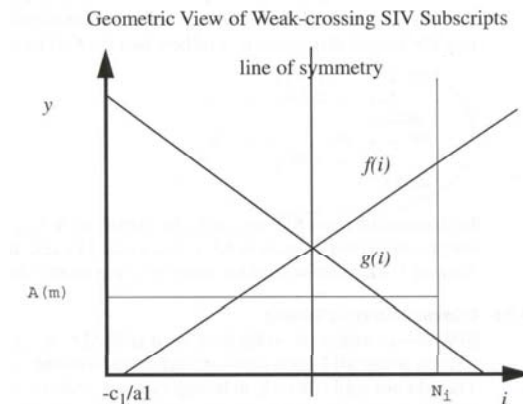

```

Y(1, N) = Y(1, N) + Y(N, N)
DO i = 2, N-1
S1   Y(i, N) = Y(1, N) + Y(N, N)
ENDDO
Y(N, N) = Y(1, N) + Y(N, N)
    
```

Weak-crossing SIV Test

- Special case of Weak SIV where the coefficients of the index are equal in magnitude but opposite in sign
- The test consists merely of checking whether the solution index
 1. within loop bounds and is
 2. either an integer or has a non-integer part equal to $\frac{1}{2}$

Weak-crossing SIV Test

Weak-crossing SIV & Loop Splitting

```
DO i = 1, N
S1  A(i) = A(N-i+1) + C
ENDDO
```

This loop can be split into...

```
DO i = 1, (N+1)/2
  A(i) = A(N-i+1) + C
ENDDO
DO i = (N+1)/2 + 1, N
  A(i) = A(N-i+1) + C
ENDDO
```

Complex Iteration Spaces

- Till now we have applied the tests only to rectangular iteration spaces
- These tests can also be extended to apply to triangular or trapezoidal loops
 - Triangular: One of the loop bounds is a function of at least one other loop index
 - Trapezoidal: Both the loop bounds are functions of at least one other loop index

Next Time...

- Complex iteration spaces
- MIV Tests
- Tests in Coupled groups
- Merging direction vectors

Complex Iteration Spaces

- For example consider this special case of a strong SIV subscript

```
DO I = 1, N
  DO J = L0 + L1*I, U0 + U1*I
S1    A(J + d) =
S2    = A(J) + B
  ENDDO
ENDDO
```

Complex Iteration Spaces

- Strong SIV test gives dependence if

$$|d| \leq U_0 - L_0 + (U_1 - L_1)I$$

$$I \geq \frac{|d| - (U_0 - L_0)}{U_1 - L_1}$$

- Unless this inequality is violated for all values of I in its iteration range, we must assume a dependence in the loop

Index Set Splitting

```
DO I = 1, 100
  DO J = 1, I
S1      A(J+20) = A(J) + B
  ENDDO
ENDDO
```

$$I < \frac{|d| - (U_0 - L_0)}{U_1 - L_1} = \frac{20 - (-1)}{1} = 21$$

For values of

there is no dependence

Index Set Splitting

- This condition can be used to partially vectorize S1 by Index set splitting as shown

```
DO I = 1, 20
  DO J = 1, I
S1a      A(J+20) = A(J) + B
  ENDDO
ENDDO
```

Index Set Splitting

```
DO I = 21, 100
  DO J = 1, Ix
S1b      A(J+20) = A(J) + B
  ENDDO
ENDDO
```

Now the inner loop for the first nest can be vectorized

Coupling makes these tests imprecise

```
DO I = 1, 100
  DO J = 1, I
S1      A(J+20, I) = A(J, 19) + B
  ENDDO
ENDDO
```

- We will report dependence even if there isn't any
- But such cases are very rare

Breaking Conditions

- Consider the following example

```
DO I = 1, L
S1      A(I + N) = A(I) + B
ENDDO
```

- If $L <= N$, then there is no dependence from S_1 to itself
- $L <= N$ is called the **Breaking Condition**

Using Breaking Conditions

- Using breaking conditions the vectorizer can generate alternative code

```
IF (L<=N) THEN
  A(N+1:N+L) = A(1:L) + B
ELSE
  DO I = 1, L
S1      A(I + N) = A(I) + B
  ENDDO
ENDIF
```

What's next...

- MIV Tests
- Tests in Coupled groups

```
for i=0 to N
  for j=0 to M
    A[j] = f(A[j]);
  for i=0 to N
    B[i] = f(B[i]);
  for j=0 to M
    A[j] = f(A[j]);
  for j=1 to M
    A[j] = f(A[j-1]);
```
