From Before... Def-Use Chains

- ...
- `for (i=0; i++; i<10) {`
 
- ... = ... i ...;
- ...
- }
- `for (i=j; i++; i<20) {`
 
- ... = i ...
- }

How is this related to RA?

Def-Use chains are expensive

```
foo(int i, int j) {  
    ...  
    switch (i) {  
        case 0: x=3; break;  
        case 1: x=1; break;  
        case 2: x=6; break;  
        case 3: x=7; break;  
        default: x = 11;  
    }  
    switch (j) {  
        case 0: y=x+7; break;  
        case 1: y=x+4; break;  
        case 2: y=x-2; break;  
        case 3: y=x+1; break;  
        default: y=x+9;  
    }  
    ...  
}
```

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

3

Def-Use chains are expensive

```
foo(int i, int j) {  
    ...  
    switch (i) {  
        case 0: x=3;  
        case 1: x=1;  
        case 2: x=6;  
        case 3: x=7;  
        default: x = 11;  
    }  
    switch (j) {  
        case 0: y=x+7;  
        case 1: y=x+4;  
        case 2: y=x-2;  
        case 3: y=x+1;  
        default: y=x+9;  
    }  
    ...  
}
```

In general,
N defs
M uses
⇒ O(NM) space and time

A solution is to limit each
var to ONE def site

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

4

Def-Use chains are expensive

```
foo(int i, int j) {  
    ...  
    switch (i) {  
        case 0: x=3; break;  
        case 1: x=1; break;  
        case 2: x=6;  
        case 3: x=7;  
        default: x = 11;  
    }  
x1 is one of the above x's  
    switch (j) {  
        case 0: y=x1+7;  
        case 1: y=x1+4;  
        case 2: y=x1-2;  
        case 3: y=x1+1;  
        default: y=x1+9;  
    }  
}
```

Lecture 4

A solution is to limit each
var to ONE def site

15-745 © Seth Copen Goldstein 2005-9

5

SSA

- Static single assignment is an **IR** where every variable is assigned a value at most once in the program text
- Easy for a basic block:
 - assign to a fresh variable at each stmt.
 - Each use uses the most recently defined var.
 - (Similar to Value Numbering)

15-745 © Seth Copen Goldstein 2005-9

6

Advantages of SSA

- Makes du-chains explicit
- Makes dataflow optimizations
 - Easier
 - faster
- Improves register allocation
 - Automatically builds Webs
 - Makes building interference graphs easier
- For most programs reduces space/time requirements

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

7

SSA History

- Developed by Wegman, Zadeck, Alpern, and Rosen in 1988
- New to gcc 4.0, used in ORC, LLVM, used in both IBM and Sun Java JIT compilers
 - and others

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

8

Straight-line SSA

```
a ← x + y
b ← a + x
a ← b + 2
c ← y + 1
a ← c + a
```

Straight-line SSA

```
a ← x + y
b ← a + x
a ← b + 2
c ← y + 1
a ← c + a
```

```
a1 ← x + y
b1 ← a1 + x
a2 ← b1 + 2
c1 ← y + 1
a3 ← c1 + a2
```

SSA

- Static single assignment is an IR where every variable is assigned a value at most once in the program text
- Easy for a basic block:
 - assign to a fresh variable at each stmt.
 - Each use uses the most recently defined var.
 - (Similar to Value Numbering)
- What about at joins in the CFG?

Merging at Joins

```
c ← 12
if (i) {
  a ← x + y
  b ← a + x
} else {
  a ← b + 2
  c ← y + 1
}
a ← c + a
```

SSA

- Static single assignment is an IR where every variable is assigned a value at most once in the program text
- Easy for a basic block:
 - assign to a fresh variable at each stmt.
 - Each use uses the most recently defined var.
 - (Similar to Value Numbering)
- What about at joins in the CFG?
 - Use a notional fiction: A Φ function

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

13

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

14

Merging at Joins

The Φ function

- Φ merges multiple definitions along multiple control paths into a single definition.
 - At a BB with p predecessors, there are p arguments to the Φ function.
- $$x_{\text{new}} \leftarrow \Phi(x_1, x_2, x_3, \dots, x_p)$$
- How do we choose which x_i to use?
 - We don't really care!
 - If we care, use moves on each incoming edge

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

15

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

16

"Implementing" Φ

Trivial SSA

- Each assignment generates a fresh variable.
- At each join point insert Φ functions for all live variables.

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

17

Minimal SSA

- Each assignment generates a fresh variable.
- At each join point insert Φ functions for all variables with **multiple outstanding defs**.

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

18

Another Example

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

19

Another Example

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

20

Lets optimize the following:

```
i=1;
j=1;
k=0;
while (k<100) {
    if (j<20) {
        j=i;
        k++;
    } else {
        j=k;
        k+=2;
    }
}
return j;
```

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

21

First, turn into SSA

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

22

Properties of SSA

- Only 1 assignment per variable
- definitions dominate uses
- Can we use this to help with constant propagation?

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

23

Constant Propagation

- If " $v \leftarrow c$ ", replace all uses of v with c
- If " $v \leftarrow \Phi(c, c, c)$ " replace all uses of v with c

```
w <- list of all defs
while !W.isEmpty {
    Stmt S <- W.removeOne
    if S has form "v <- Φ(c,...,c)"
        replace S with v <- c
    if S has form "v <- c" then
        delete S
    foreach stmt U that uses v,
        replace v with c in U
    W.add(U)
}
```

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

24

Constant Propagation

Constant Propagation

Constant Propagation

But, so what?

Other stuff we can do?

- Copy propagation

delete " $x \leftarrow \Phi(y)$ " and replace all x with y
delete " $x \leftarrow y$ " and replace all x with y

- Constant Folding

(Also, constant conditions too!)

- Unreachable Code

Remember to delete all edges from unreachable block

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

29

But, so what?

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

30

Conditional Constant Propagation

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

31

CCP data structures & lattice

Keep track of:

- Blocks (assume unexecuted until proven otherwise)
- Variables (assume not executed, only with proof of assignments of a non-constant value do we assume not constant)

Use a lattice for variables:

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

32

CCP

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

41

We can do more ...

When do we insert Φ ?

If there is a def of a in block 5, which nodes need a $\Phi()$?

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

42

When do we insert Φ ?

- We insert a Φ function for variable A in block Z iff:
 - A was defined more than once before (i.e., A defined in X and Y AND $X \neq Y$)
 - There exists a non-empty path from x to z , P_{xz} , and a non-empty path from y to z , P_{yz} s.t.
 - $P_{xz} \cap P_{yz} = \{ z \}$
 - $z \notin P_{xq}$ or $z \notin P_{xr}$ where $P_{xz} = P_{xq} \rightarrow z$ and $P_{yz} = P_{xr} \rightarrow z$
 - Entry block contains an implicit def of all vars
 - Note: $A = \Phi(\dots)$ is a def of A

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

43

Dominance Property of SSA

- In SSA definitions dominate uses.
 - If x_i is used in $x \leftarrow \Phi(\dots, x_i, \dots)$, then $BB(x_i)$ dominates i th pred of $BB(\text{PHI})$
 - If x is used in $y \leftarrow \dots x \dots$, then $BB(x)$ dominates $BB(y)$
- We can use this for an efficient alg to convert to SSA

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

44

Dominance

CFG

x strictly dominates w ($s \text{ sdom } w$) iff $x \text{ dom } w$ AND $x \neq w$

D-Tree

If there is a def of a in block 5, which nodes need a $\Phi()$?

Dominance Frontier

CFG

The dominance Frontier of a node x = $\{ w \mid x \text{ dom pred}(w) \text{ AND } !(x \text{ sdom } w)\}$

D-Tree

x strictly dominates w ($s \text{ sdom } w$) iff $x \text{ dom } w$ AND $x \neq w$

Dominance Frontier & path-convergence

Computing Dominance Frontier

- You've probably already seen a $O(n^3)$ iterative algorithm
- There's also a near linear time algorithm due to Tarjan and Lengauer (Chap 19.2)
 - SSA construction therefore near linear
 - SSA form makes many optimizations linear (no need for iterative data flow)

Side trip: Dominators

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

49

Dominators

- $a \text{ dom } b$
- block a dominates block b if every possible execution path from *entry* to b includes a
 - *entry* dominates everything
 - 0 dominates everything but *entry*
 - 1 dominates 2 and 1

Dominators are useful in identifying "natural" loops

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

50

Definitions

- $a \text{ sdom } b$
- If a and b are different blocks and $a \text{ dom } b$, we say that a strictly dominates b
- $a \text{ idom } b$
- If $a \text{ sdom } b$, and there is no c such that $a \text{ sdom } c$ and $c \text{ sdom } b$, we say that a is the immediate dominator of b

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

51

Properties of Dom

- Dominance is a partial order on the blocks of the flow graph, i.e.,
- 1. Reflexivity: $a \text{ dom } a$ for all a
- 2. Anti-symmetry: $a \text{ dom } b$ and $b \text{ dom } a$ implies $a = b$
- 3. Transitivity: $a \text{ dom } b$ and $b \text{ dom } c$ implies $a \text{ dom } c$
- NOTE: there may be blocks a and b such that neither $a \text{ dom } b$ or $b \text{ dom } a$ holds.
- The dominators of each node n are linearly ordered by the dom relation. The dominators of n appear in this linear order on any path from the initial node to n .

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

52

Computing dominators

- We want to compute $D[n]$, the set of blocks that dominate n

Initialize each $D[n]$ (except $D[\text{entry}]$) to be the set of all blocks, and then iterate until no $D[n]$ changes:

$$D[\text{entry}] = \{\text{entry}\}$$

$$D[n] = \{n\} \cup \left(\bigcap_{p \in \text{pred}(n)} D[p] \right), \quad \text{for } n \neq \text{entry}$$

[Skip example](#)

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

53

Example

block	Initialization
	$D[n]$
entry	$\{\text{entry}\}$
0	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$
1	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$
2	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$
3	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$
4	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$
5	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$
exit	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

54

Example

block	Initialization	First Pass
	$D[n]$	$D[n]$
entry	$\{\text{entry}\}$	$\{\text{entry}\}$
0	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$	$\{0, \text{entry}\}$
1	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$	$\{1, 0, \text{entry}\}$
2	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$	$\{2, 1, 0, \text{entry}\}$
3	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$	$\{3, 1, 0, \text{entry}\}$
4	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$	$\{4, 0, \text{entry}\}$
5	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$	$\{5, 4, 0, \text{entry}\}$
exit	$\{\text{entry}, 0, 1, 2, 3, 4, 5, \text{exit}\}$	$\{\text{exit}, 3, 1, 0, \text{entry}\}$

Update rule:

$$D[n] = \{n\} \cup \left(\bigcap_{p \in \text{pred}(n)} D[p] \right)$$

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

55

Example

block	First Pass	Second Pass
	$D[n]$	$D[n]$
entry	$\{\text{entry}\}$	$\{\text{entry}\}$
0	$\{0, \text{entry}\}$	$\{0, \text{entry}\}$
1	$\{1, 0, \text{entry}\}$	$\{1, 0, \text{entry}\}$
2	$\{2, 1, 0, \text{entry}\}$	$\{2, 1, 0, \text{entry}\}$
3	$\{3, 1, 0, \text{entry}\}$	$\{3, 0, \text{entry}\}$
4	$\{4, 0, \text{entry}\}$	$\{4, 0, \text{entry}\}$
5	$\{5, 4, 0, \text{entry}\}$	$\{5, 4, 0, \text{entry}\}$
exit	$\{\text{exit}, 3, 1, 0, \text{entry}\}$	$\{\text{exit}, 3, 0, \text{entry}\}$

Update rule:

$$D[n] = \{n\} \cup \left(\bigcap_{p \in \text{pred}(n)} D[p] \right)$$

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

56

Example

block	Second Pass D[n]	Third Pass D[n]
entry	{entry}	{entry}
0	{0,entry}	{0,entry}
1	{1,0,entry}	{1,0,entry}
2	{2,1,0,entry}	{2,1,0,entry}
3	{3,0,entry}	{3,0,entry}
4	{4,0,entry}	{4,0,entry}
5	{5,4,0,entry}	{5,4,0,entry}
exit	{exit,3,0,entry}	{exit,3,0,entry}

Update rule: $D[n] = \{n\} \cup \left(\bigcap_{p \in pred(n)} D[p] \right)$

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

57

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

58

Computing dominators

- Iterative algorithm is $O(n^2e)$
 - assuming bit vector sets
- More efficient algorithm due to Lengauer and Tarjan
 - $O(e \cdot \alpha(e,n))$ *inverse Ackermann*
 - much more complicated
 - your book provides a simple algorithm that is very fast in practice
 - faster than Tarjan algorithm for any realistic CFG

Computing dominators

- Let $sD[n]$ be the set of blocks that strictly dominate n , then

$$sD[n] = D[n] - \{n\}$$

- To compute $iD[n]$, the set of blocks (size ≤ 1) that immediately dominate n

$$iD[n] = sD[n]$$

- Set

- Repeat until no $iD[n]$ changes:

$$iD[n] = iD[n] - \bigcup_{d \in iD[n]} (sD[d])$$

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

59

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

60

Example

block	Initialization $iD[n]=sD[n]$	First Pass $iD[n]$
entry	{}	{}
0	{entry}	{entry}
1	{0,entry}	{0,entry}
2	{1,0,entry}	{1,0,entry}
3	{0,entry}	{0,entry}
4	{0,entry}	{0,entry}
5	{4,0,entry}	{4,0,entry}
exit	{3,0,entry}	{3,0,entry}

Update rule: $iD[n] = iD[n] - \bigcup_{d \in iD[n]} (sD[d])$

Dominator Tree

In the dominator tree the initial node is the entry block, and the parent of each other node is its immediate dominator.

block	iD[n]
entry	{}
0	{entry}
1	{0}
2	{1}
3	{0}
4	{0}
5	{4}
exit	{3}

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

61

- Block a post-dominates b (a pdom b) if every path from a to the exit block includes b
- pdom on CFG is the same as dom on the reverse (all edges reversed) CFG
- 0 post-dominates ?
1 post-dominates ?
4 post-dominates ?

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

62

Dominance Frontier

- If z is the first node we encounter on the path from x which x does not strictly dominate, z is in the dominance frontier of x
- For some path from node x to z , $x \rightarrow \dots \rightarrow y \rightarrow z$ where $x \text{ dom } y$ but not $x \text{ sdom } z$.
- Dominance frontier of 1?
- Dominance frontier of 2?
- Dominance frontier of 4?

63

Calculating the Dominance Frontier

- Let $\text{dominates}[n]$ be the set of all blocks which block n dominates
 - subtree of dominator tree with n as the root
- The dominance frontier of n , $DF[n]$ is

$$DF[n] = \left(\bigcup_{s \in \text{dominates}[n]} \text{succs}(s) \right) - (\text{dominates}[n] - \{n\})$$

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

Skip example

64

Example

First calculate $\text{dominates}[n]$ from the dominator tree

block	$\text{dominates}[n]$
entry	{entry,0,1,2,3,4,5,exit}
0	{0,1,2,3,4,5,exit}
1	{1,2}
2	{2}
3	{3,exit}
4	{4,5}
5	{5}
exit	{exit}

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

65

Example

Then compute the successor set of $\text{dominates}[n]$

block	$\text{dominates}[n]$	$\text{succ}(\text{dominates}[n])$
entry	{entry,0,1,2,3,4,5,exit}	
0	{0,1,2,3,4,5,exit}	
1	{1,2}	
2	{2}	
3	{3,exit}	
4	{4,5}	
5	{5}	
exit	{exit}	{}

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

66

Example

Finally, remove all the blocks from the successor set that are strictly dominated by n to get $\text{DF}[n]$

block	$s\text{dominates}[n]$	$\text{succ}(\text{dominates}[n])$	$\text{DF}[n]$
entry	{entry,0,1,2,3,4,5,exit}	{0,1,2,3,4,5,exit}	
0	{0,1,2,3,4,5,exit}	{1,2,3,4,5,exit}	
1	{1,2}	{2,3}	
2	{2}	{3}	
3	{3,exit}	{exit}	..
4	{4,5}	{3,4,5}	
5	{5}	{3,4}	
exit	{exit}	{}	{}

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

67

Example

block	$\text{DF}[n]$
entry	{}
0	{}
1	{3}
2	{3}
3	{}
4	{3,4}
5	{3,4}
exit	{}

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

68

Recap

- $a \text{ dom } b$
 - every possible execution path from *entry* to b includes a
- $a \text{ sdom } b$
 - $a \text{ dom } b$ and $a \neq b$
- $a \text{ idom } b$
 - a is "closest" dominator of b
- $a \text{ pdom } b$
 - every path from a to the exit block includes b
- Dominator trees
- Dominance frontier

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

69

Using DF to compute SSA

- place all $\Phi()$
- Rename all variables

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

70

Using DF to Place $\Phi()$

- Gather all the defsites of every variable
- Then, for every variable
 - foreach defsite
 - foreach node in $\text{DF}(\text{defsite})$
 - if we haven't put $\Phi()$ in node put one in
 - If this node didn't define the variable before: add this node to the defsites
- This essentially computes the Iterated Dominance Frontier on the fly, inserting the minimal number of $\Phi()$ necessary

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

71

Using DF to Place $\Phi()$

```
foreach node n {  
    foreach variable v defined in n {  
        orig[n] ∪= {v}  
        defsites[v] ∪= {n}  
    }  
    foreach variable v {  
        w = defsites[v]  
        while W not empty {  
            foreach y in DF[n]  
            if y ∉ PHI[v] {  
                insert "v ← Φ(v,v,...)" at top of y  
                PHI[v] = PHI[v] ∪ {y}  
                if v ∉ orig[y]: w = w ∪ {y}  
            }  
        }  
    }  
}
```

72

Renaming Variables

- Walk the D-tree, renaming variables as you go
- Replace uses with more recent renamed def
 - For straight-line code this is easy
 - If there are branches and joins?

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

73

Renaming Variables

- Walk the D-tree, renaming variables as you go
- Replace uses with more recent renamed def
 - For straight-line code this is easy
 - If there are branches and joins use the closest def such that the def is above the use in the D-tree
- Easy implementation:
 - for each var: rename (v)
 - rename(v): replace uses with top of stack at def: push onto stack call rename(v) on all children in D-tree for each def in this block pop from stack

SSA Properties

- Only 1 assignment per variable
- definitions dominate uses

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

86

Dead Code Elimination

```

W <- list of all defs
while !W.isEmpty {
    Stmt S <- W.removeOne
    if |S.users| != 0 then continue
    if S.hasSideEffects() then continue
    foreach def in S.definers {
        def.users <- def.users - {s}
        if |def.uses| == 0 then
            W <- W UNION {def}
        delete S
    }
}

```

Since we are using SSA,
this is just a list of all
variable assignments.

88

Standard DCE leaves Zombies!

Aggressive Dead Code Elimination

Assume a stmt is dead until proven otherwise.

```

init:
  mark as live all stmts that have side-effects:
    - I/O
    - stores into memory
    - returns
    - calls a function that MIGHT have side-effects
  As we mark S alive, insert S.defs into W

while (|W| > 0) {
  S <- W.removeOne()
  if (S is alive) continue;
  mark S alive, insert S.defs into W
}
  
```

93

Control Dependence

Y is control-dependent on X if

- X branches to u and v

- \exists a path $u \rightarrow \text{exit}$ which does not go through Y
- \forall paths $v \rightarrow \text{exit}$ go through Y

IOW, X can determine whether or not Y is executed.

15-745 © Seth Copen Goldstein 2005-9

94

Finding the CDG

Y is control-dependent on X if

- X branches to u and v

- \exists a path $u \rightarrow \text{exit}$ which does not go through Y

- \forall paths $v \rightarrow \text{exit}$ go through Y

IOW, X can determine whether or not Y is executed.

Lecture 4

15-745 © Seth Copen Goldstein 2005-9

95

Finding the CDG

- Construct CFG

- Add entry node and exit node

- Add (entry,exit)

- Create G' , the reverse CFG

- Compute D-tree in G' (post-dominators of G)

- Compute $DF_{G'}(y)$ for all $y \in G'$ (post-DF of G)

- Add $(x,y) \in G$ to CDG if $x \in DF_{G'}(y)$
