## Lecture 12

Region-Based Analysis
I. Basic Idea
II. Algorithm
III. Optimization and Complexity
IV. Comparing region-based analysis with iterative algorithms

Reading: ALSU 9.7

15-745: Region-Based Analysis
Carnegie Mellon
Todd C. Mowry

- Exploit the structure of block-structured programs in data flow
- Tie in several concepts studied:
- Use of structure in induction variables, loop invariant
- motivated by nature of the problem
- This lecture: can we use structure for speed?
- Iterative algorithm for data flow
- This lecture: an alternative algorithm
- Reducibility
- all retreating edges of DFST are back edges
- reducible graphs converge quickly
- This lecture: algorithm exploits \& requires reducibility
- Usefulness in practice
- Faster for "harder" analyses
- Useful for analyses related to structure
- Theoretically interesting: better understanding of data flow

## I. Big Picture

15-745: Region-Based Analysis

## Basic Idea

- In Iterative Analysis:
- DEFINITION: Transfer function $\mathrm{F}_{\mathrm{B}}$ :
summarize effect from beginning to end of basic block $B$
- In Region-Based Analysis:
- DEFINITION: Transfer function $F_{R, B}$
summarize effect from beginning of $R$ to end of basic block $B$
- Recursively
construct a larger region $R$ from smaller regions
construct $F_{R, B}$ from transfer functions for smaller regions until the program is one region
- Let $P$ be the region for the entire program,
and $v$ be initial value at entry node
- out $[B]=F_{P, B}(v)$
- in $[B]=\wedge_{B^{\prime}}$ out $\left[B^{\prime}\right]$, where $B^{\prime}$ is a predecessor of $B$

[^0]
## II. Algorithm

1. Operations on transfer functions
2. How to build nested regions?
3. How to construct transfer functions that correspond to the larger regions?

## 2. Structure of Nested Regions (An Example)

- A region in a flow graph is a set of nodes that
- includes a header, which dominates all other nodes in a region
- T1-T2 rule (Hecht \& Ullman)

Ti: Remove a loop
If $n$ is a node with a loop, i.e. an edge $n->n$, delete that edge

- T2: Remove a vertex

If there is a node $n$ that has a unique predecessor, $m$, then $m$ may consume $n$ by
deleting $n$ and making all successors of $n$ be successors of $m$.

Carnegie Mellon
Todd C. Mowry

## 1. Operations on Transfer Functions

## - Example: Reaching Definitions

- $F(x)=\operatorname{Gen} \cup(x-$ Kill $)$
- $F_{2}\left(F_{1}(x)\right)=\operatorname{Gen}_{2} \cup\left(F_{1}(x)-\right.$ Kill $\left._{2}\right)$
$=\operatorname{Gen}_{2} \cup\left(\right.$ Gen $_{1} \cup\left(x-\right.$ Kill $\left.\left._{1}\right)\right)-$ Kill $\left._{2}\right)$
$=\operatorname{Gen}_{2} \cup\left(\right.$ Gen $_{1}-$ Kill $\left._{2}\right) \cup\left(x-\left(\right.\right.$ Kill $_{1} \cup$ Kill $\left.\left._{2}\right)\right)$
- $F_{1}(x) \wedge F_{2}(x)=$ Gen $_{1} \cup\left(x-\right.$ Kill $\left._{1}\right) \cup$ Gen $_{2} \cup\left(x-\right.$ Kill $\left._{2}\right)$

$$
=\left(\operatorname{Gen}_{1} \cup \operatorname{Gen}_{2}\right) \cup\left(x-\left(\text { Kill }_{1} \cap \text { Kill }_{2}\right)\right)
$$

- $F^{*}(x) \leq F^{n}(x), \forall n \geq 0$
$=x \cup F(x) \cup F(F(x)) \cup$.
$=x \cup(\operatorname{Gen} \cup(x-$ Kill $)) \cup(\operatorname{Gen} \cup((\operatorname{Gen} \cup(x-$ Kill $))-$ Kill $)) \cup \ldots$
$=\operatorname{Gen} \cup(x-\varnothing)$

```
15-745: Region-Based Analysis

\section*{Example}
- In reduced graph:
- each vertex represents a subgraph of original graph (a region)
- each edge represents an edge in original graph
- Limit flow graph: result of exhaustive application of T1 and T2
- independent of order of application.
- if limit flow graph has a single vertex \(\rightarrow\) reducible
- Can define larger regions (e.g. Allen\&Cocke's intervals)
- simple regions \(\rightarrow\) simple composition rules for transfer functions

\section*{3. Transfer Functions for T2 Rule}

- Transfer function
\(F_{R, B}\) : summarizes the effect from beginning of \(R\) to end of \(B\)
\(F_{R, i n(H 2)}\) : summarizes the effect from beginning of \(R\) to beginning of \(H 2\)
- Unchanged for blocks \(B\) in region \(R_{1}\left(F_{R, B}=F_{R 1, B}\right)\)
- \(F_{R, i n(H 2)}=\wedge_{p} F_{R, P}\), where \(p\) is a predecessor of \(H_{2}\)
- For blocks \(B\) in region \(R_{2}: F_{R, B}=F_{R 2, B} \cdot F_{R, \text { in(H2) }}\)

15-745: Region-Based Analysis
negie Mellon
Todd C. Mowry

First Example

- R: region name
- \(R^{\prime}\) : region whose header will be subsumed
\begin{tabular}{ll|l} 
15-745: Region-Based Analysis & 11 & \(\begin{array}{c}\text { Carnegie Mellon } \\
\text { Todd C. Mowry }\end{array}\)
\end{tabular}

Transfer Functions for T1 Rule

- Transfer Function \(F_{R, B}\)
- \(F_{R, \operatorname{in}(H)}=\left(\wedge_{P} F_{R 1, P}\right)^{*}\), where \(p\) is a predecessor of H in \(R\)
\(-F_{R, B}=F_{R 1, B} \cdot F_{R, \operatorname{in}(H)}\)
First Example

\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline R & \(\mathrm{T}_{1} \mathrm{~T}_{2}\) & R' & \(F_{\text {R,in(R) }}\) & \(\mathrm{F}_{\mathrm{R}, \mathrm{B1}}\) & \(\mathrm{F}_{\mathrm{R}, \mathrm{B} 2}\) & \(\mathrm{F}_{\mathrm{R}, \mathrm{B} 3}\) & \(\mathrm{F}_{\mathrm{R}, 84}\) \\
\hline \(\mathrm{R}_{1}\) & \(\mathrm{T}_{2}\) & \(\mathrm{B}_{2}\) & \(\mathrm{F}_{\mathrm{B} 1}\) & \(\mathrm{F}_{\mathrm{B} 1}\) & \(\mathrm{F}_{\mathrm{B2}} \cdot \mathrm{~F}_{\text {R1, } 1(32)}\) & & \\
\hline \(\mathrm{R}_{2}\) & \(\mathrm{T}_{2}\) & \(\mathrm{R}_{1}\) & \(\mathrm{F}_{\text {B }}\) &  &  & \(\mathrm{F}_{\text {B3 }}\) & \\
\hline \(\mathrm{R}_{3}\) & \(\mathrm{T}_{1}\) & \(\mathrm{R}_{2}\) & \(\left(F_{\text {R281 }} F_{\text {R2822 }}\right)^{*}\) & \(F_{R 2,81} \cdot F_{R 3, i n(R 2)}\) & \(\mathrm{F}_{\mathrm{R} 2,82} \cdot \mathrm{~F}_{\mathrm{R} 3 \text {; } \mathrm{n}(22)}\) & \(\mathrm{F}_{\mathrm{R} 2,33} \cdot \mathrm{~F}_{\mathrm{R} 3, \mathrm{in}(2)}\) & \\
\hline \(\mathrm{R}_{4}\) & \(\mathrm{T}_{2}\) & \(\mathrm{B}_{4}\) & \(\mathrm{F}_{\text {R3B }} \wedge \wedge_{\text {R332 }}\) & \(\mathrm{F}_{\mathrm{R},{ }^{\text {B }} \text { 1 }}\) & \(\mathrm{F}_{\mathrm{R} 3, \mathrm{B2}}\) & \(\mathrm{F}_{\mathrm{R} 3,83}\) & \(\mathrm{F}_{84} \cdot \mathrm{~F}_{\text {R4, in(34) }}\) \\
\hline
\end{tabular}
- R: region name
- \(R^{\prime}\) : region whose header will be subsumed

}

\section*{Optimization}
- Let \(m=\) number of edges, \(n=\) number of nodes
- Ideas for optimization
- If we compute \(F_{R, B}\) for every region \(B\) is in, then it is very expensive
- We are ultimately only interested in the entire region ( \(E\) ):
we need to compute only \(F_{E, B}\) for every \(B\).
- There are many common subexpressions between \(F_{E, B 1}, F_{E, B 2}, \ldots\)
- Number of \(F_{E, B}\) calculated \(=m\)
- Also, we need to compute \(F_{R, i n\left(R^{\prime}\right)}\), where \(R^{\prime}\) represents the region whose header is subsumed.
- Number of \(F_{R, B}\) calculated, where \(R\) is not final \(=n\)
- Total number of \(F_{R, B}\) calculated: \((m+n)\)
- Data structure keeps "header" relationship
- Practical algorithm: \(O(m \log n)\)
- Complexity: \(O(m \alpha(m, n)), \alpha\) is inverse Ackermann function
```

15-745: Region-Based Analysis

## IV. Comparison with Iterative Data Flow

- Applicability
- Definitions of $F^{*}$ can make technique more powerful than iterative algorithms
- Backward flow: reverse graph is not typically reducible.
- Requires more effort to adapt to backward flow than iterative algorithm
- More important for interprocedural optimization
- Speed
- Irreducible graphs
- Iterative algorithm can process irreducible parts uniformly
- Serious "irreducibility" can be slow with region-based analysis
- If no T1, T2 is applicable before graph is reduced to single node, then split node and continue
- Worst case: exponential
- Most graphs (including GOTO programs) are reducible
- Reducible graph \& Cycles do not add information (common)
- Iterative: (depth +2 ) passes
depth is 2.75 average, independent of code length
- Region-based analysis: Theoretically almost linear, typically $O(m \log n)$
- Reducible \& Cycles add information

Iterative takes longer to converge

- Region-based analysis remains the same
