Types of distortions

Model-based approach

$$\frac{\partial^2 h(x,t)}{\partial t^2} = c^2 \nabla^2 h(x,t)$$

Physics of
water dynamics

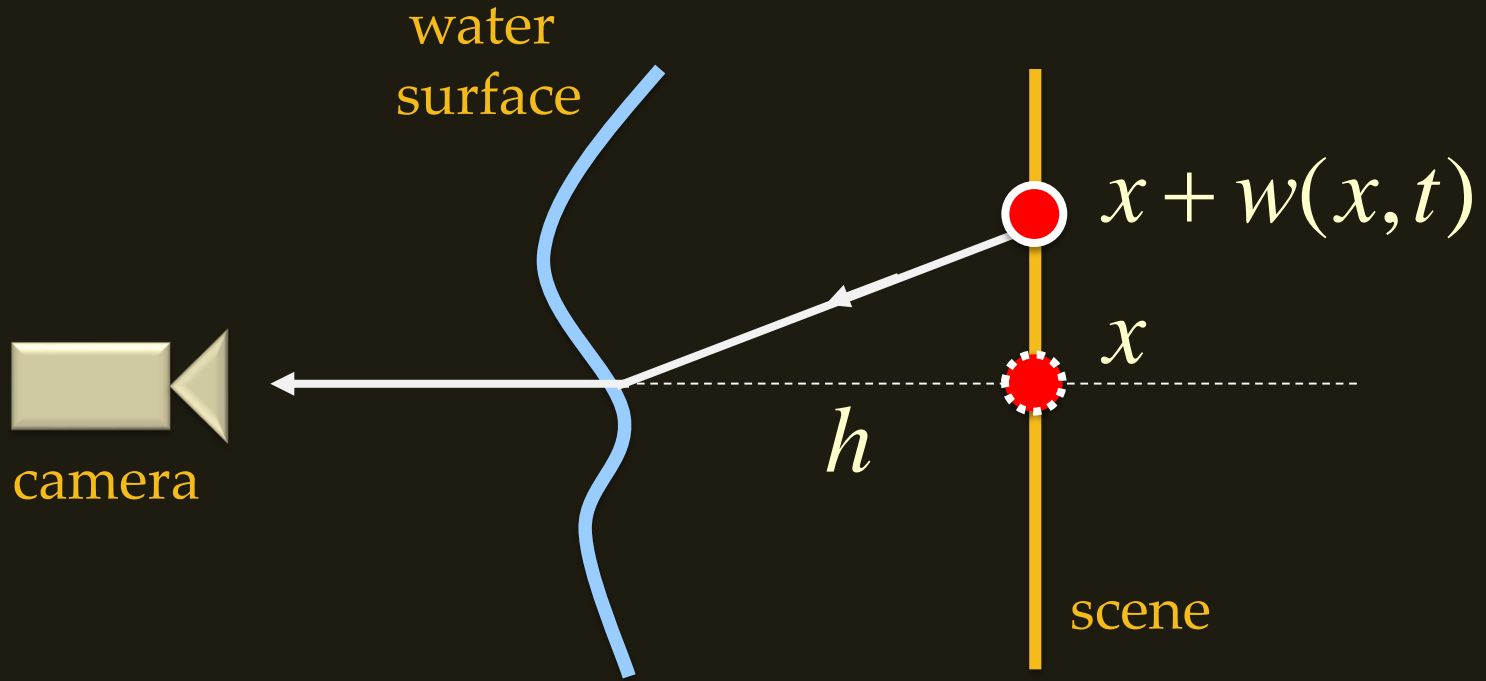

+

Smooth and
locally similar surface

Model governed by only a few parameters

Image formation

Distorted Image

Video Frame Scene Distortion

$$I(\mathbf{x}, t) = I_g(\mathbf{x} + \mathbf{w}(\mathbf{x}, t))$$

Image Distortion:

$$w(x, t) = \alpha \nabla h(x, t)$$

Water dynamics

Wave equation:

$$\frac{\partial^2 h(x, t)}{\partial t^2} = c^2 \nabla^2 h(x, t)$$

water height

wave speed

Initial condition:

Random water height

Simulating water distortions

terpre

Compact bases using PCA

- Distortion Parameter Reduction

x-components

y-components

We use 10 principle components

- Image Distortion

PCA Bases

Warping Coeffs.

$$\mathbf{w}(\mathbf{x}, t) \approx \mathbf{B}(\mathbf{x}) \mathbf{p}_t$$

Arrows point from 'PCA Bases' to $\mathbf{B}(\mathbf{x})$ and from 'Warping Coeffs.' to \mathbf{p}_t .

Validating reduction of dimensions

- Original

- Distorted

- Reconstructed

Water tracking with no template

- Frame-to-scene mapping:

- Objective function:

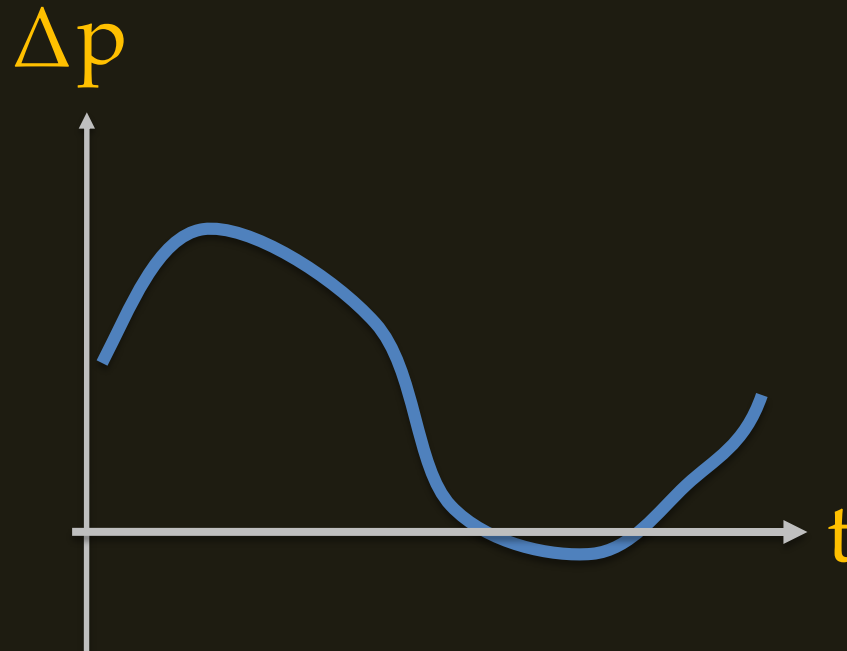

$$J(\mathbf{p}_s, \mathbf{p}_t) = \left(\overset{\text{Undistorted}}{\text{Frame s}} \hat{I}_g(\mathbf{y}, s) - \overset{\text{Undistorted}}{\text{Frame t}} \hat{I}_g(\mathbf{y}, t) \right)^2$$

Exploiting temporal continuity

Exploiting Temporal Stationarity

With $\{\Delta p_{c,t}\}$, the last piece of information: p_c

Water is a common chemical substance that is essential for the survival of all known forms of life. In typical usage, water refers only to its liquid form or state, but the substance also has a solid state, ice, and a gaseous state, water vapor or steam. Water covers 71% of the Earth's surface[1]. On Earth, it is found mostly in oceans and other large water bodies, with 1.6% of water below ground in aquifers and 0.001% in the air as vapor, clouds (formed of solid and liquid water particles suspended in air), and precipitation [2]. Saltwater oceans hold 97% of surface water, glaciers and polar ice caps 2.4%, and other land surface water such as rivers, lakes and ponds 0.6%.

Paper Summary

- Rating – 1.5
- Pros:
 - Provides compact model of water surface
 - Water tracking using temporal information
 - Image restoration and water surface reconstruction
 - Well written, nice figures
- Cons:
 - Requires higher than normal fps camera (125 Hz)
 - Does not work when caustics, reflections, or significant refractions are present
 - Requires knowing the wave speed and eyeballing smoothness of waves
 - Does not model boundary effects near edges, or viscosity, surface tension, and high frequency effects
