

15-853: Algorithms in the Real World

Linear and Integer Programming I

- Introduction
- Geometric Interpretation
- Simplex Method

15-853

Page1

Linear and Integer Programming

Linear or Integer programming

minimize $z = c^T x$ **cost or objective function**
subject to $Ax \leq b$ **equalities**
 $x \geq 0$ **inequalities**
 $c \in \mathbb{R}^n, b \in \mathbb{R}^m, A \in \mathbb{R}^{n \times m}$

Linear programming:

$x \in \mathbb{R}^n$ (polynomial time)

Integer programming:

$x \in \mathbb{Z}^n$ (NP-complete)

Extremely general framework, especially IP

15-853

Page2

Related Optimization Problems

Unconstrained optimization

$\min\{f(x) : x \in \mathbb{R}^n\}$

Constrained optimization

$\min\{f(x) : c_i(x) \leq 0, i \in I, c_j(x) = 0, j \in E\}$

Quadratic programming

$\min\{1/2x^T Q x + c^T x : a_i^T x \leq b_i, i \in I, a_j^T x = b_j, j \in E\}$

Zero-One programming

$\min\{c^T x : Ax = b, x \in \{0,1\}^n, c \in \mathbb{R}^n, b \in \mathbb{R}^m\}$

Mixed Integer Programming

$\min\{c^T x : Ax \leq b, x \geq 0, x_i \in \mathbb{Z}^n, i \in I, x_r \in \mathbb{R}^n, r \in R\}$

15-853

Page3

How important is optimization?

- 50+ packages available
- 1300+ papers just on interior-point methods
- 100+ books in the library
- 10+ courses at most Universities
- 100s of companies
- All major airlines, delivery companies, trucking companies, manufacturers, ... make serious use of optimization.

15-853

Page4

Linear+Integer Programming Outline

Linear Programming

- General formulation and geometric interpretation
- Simplex method
- Ellipsoid method
- Interior point methods

Integer Programming

- Various reductions of NP hard problems
- Linear programming approximations
- Branch-and-bound + cutting-plane techniques
- Case study from Delta Airlines

15-853

Page5

Applications of Linear Programming

1. A substep in most integer and mixed-integer linear programming (MIP) methods
2. Selecting a mix: oil mixtures, portfolio selection
3. Distribution: how much of a commodity should be distributed to different locations.
4. Allocation: how much of a resource should be allocated to different tasks
5. Network Flows

15-853

Page6

Linear Programming for Max-Flow

Create two variables per edge: x_1 x_1'

Create one equality per vertex:

$$x_1 + x_2 + x_3' = x_1' + x_2' + x_3$$

and two inequalities per edge:

$$x_1 \leq 3, x_1' \leq 3$$

add edge x_0 from out to in

maximize x_0

15-853

Page7

In Practice

In the "real world" most problems involve at least some integral constraints.

- Many resources are integral
- Can be used to model yes/no decisions (0-1 variables)

Therefore "1. A subset in integer or MIP programming" is the most common use in practice

15-853

Page8

Algorithms for Linear Programming

- **Simplex** (Dantzig 1947)
 - **Ellipsoid** (Kachian 1979)
first algorithm known to be **polynomial time**
 - **Interior Point**
first practical polynomial-time algorithms
 - **Projective method** (Karmakar 1984)
 - **Affine Method** (Dikin 1967)
 - **Log-Barrirer Methods** (Frisch 1977, Fiacco 1968, Gill et.al. 1986)
- Many of the interior point methods can be applied to nonlinear programs. Not known to be poly. time

15-853

Page9

State of the art

- 1 million variables
10 million nonzeros
- No clear winner between Simplex and Interior Point
- Depends on the problem
 - Interior point methods are subsuming more and more cases
 - All major packages supply both
- The truth:** the sparse matrix routines, make or break both methods.
The best packages are highly sophisticated.

15-853

Page10

Comparisons, 1994

| problem | Simplex (primal) | Simplex (dual) | Barrier + crossover |
|--------------|------------------|----------------|---------------------|
| binpacking | 29.5 | 62.8 | 560.6 |
| distribution | 18,568.0 | won't run | too big |
| forestry | 1,354.2 | 1,911.4 | 2,348.0 |
| maintenance | 57,916.3 | 89,890.9 | 3,240.8 |
| crew | 7,182.6 | 16,172.2 | 1,264.2 |
| airfleet | 71,292.5 | 108,015.0 | 37,627.3 |
| energy | 3,091.1 | 1,943.8 | 858.0 |
| 4color | 45,870.2 | won't run | too big |

15-853

Page11

Formulations

There are many ways to formulate linear programs:

- **objective (or cost) function**
maximize $c^T x$, or
minimize $c^T x$, or
find any feasible solution
- **(in)equalities**
 $Ax \leq b$, or
 $Ax \geq b$, or
 $Ax = b$, or any combination
- **nonnegative variables**
 $x \geq 0$, or not

Fortunately it is pretty easy to convert among forms

15-853

Page12

Formulations

The two **most common** formulations:

| Canonical form | | Standard form |
|--|--|---|
| minimize $c^T x$ subject to $Ax \geq b$ $x \geq 0$ | $\xrightarrow{\text{slack variables}}$ | minimize $c^T x$ subject to $Ax = b$ $x \geq 0$ |

e.g.

| | | |
|---|---------------------|---|
| $7x_1 + 5x_2 \geq 7$ $x_1, x_2 \geq 0$ | $\xrightarrow{y_1}$ | $7x_1 + 5x_2 - y_1 = 7$ $x_1, x_2, y_1 \geq 0$ |
|---|---------------------|---|

More on slack variables later.

15-853

Page13

Geometric View of Canonical Form

A **polytope** in n-dimensional space

Each inequality corresponds to a half-space.

The "feasible set" is the intersection of the half-spaces

This corresponds to a polytope

Polytopes are **convex**: if x, y is in the polytope, so is the line segment joining them.

The optimal solution is at a vertex (i.e., a corner).

15-853

Page14

Geometric View of Canonical Form

minimize:

$$z = -2x_1 - 3x_2$$

subject to:

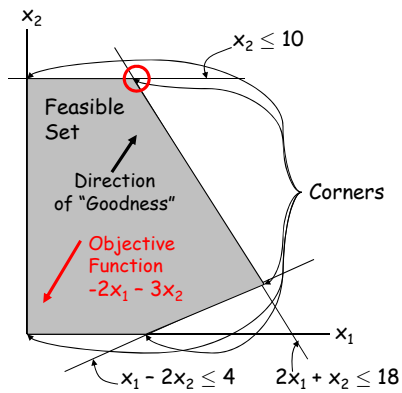

$$x_1 - 2x_2 \leq 4$$

$$2x_1 + x_2 \leq 18$$

$$x_2 \leq 10$$

$$x_1, x_2 \geq 0$$

An intersection of 5 halfspaces

15-853

Page15

Optimum is at a Vertex

Holds even if the objective function is merely **convex**:

f is convex if for all vectors x, y in S and β in $[0,1]$

$$f(\beta x + (1 - \beta)y) \leq \beta f(x) + (1 - \beta)f(y)$$

15-853

Page16

Optimum is at a Vertex

If f is linear, then
 $f(q) = f(\sum \beta_i v_i) = \sum \beta_i f(v_i)$ so
 $\min_i f(v_i) \leq f(q) \leq \max_i f(v_i)$

15-853

Page17

Every point q in P is a convex combination of vertices of P .
 There exist β_i
 $q = \sum \beta_i v_i$

Fix convex f , then
 $f(q) = f(\sum \beta_i v_i)$
 $\leq \sum \beta_i f(v_i)$
 $\leq \max_i f(v_i)$

Geometric View of Canonical Form

A **polytope** in n -dimensional space

Each inequality corresponds to a half-space.

The "feasible set" is the intersection of the half-spaces.

This corresponds to a polytope

The optimal solution is at a corner.

Simplex moves around on the surface of the polytope

Interior-Point methods move within the polytope

15-853

Page18

Notes about higher dimensions

For n dimensions and no degeneracy

(i.e., A has full row rank)

Each corner (extreme point) consists of:

- n intersecting $n-1$ dimensional **hyperplanes**
 e.g. $n = 3$, 2d planes in 3d
- n intersecting **edges**

Each edge corresponds to moving off of one hyperplane (still constrained by $n-1$ of them)

Simplex will move from corner to corner along the edges

15-853

Page19

The Simple Essence of Simplex

Polytope P

Input: $\min f(x) := cx$
 s.t. x in $P := \{x: Ax \leq b, x \geq 0\}$

Consider Polytope P from canonical form as a graph $G = (V, E)$ with
 V = polytope vertices,
 E = polytope edges.

- 1) Find *any* vertex v of P .
- 2) While there exists a neighbor u of v in G with $f(u) < f(v)$, update v to u .
- 3) Output v .

Choice of neighbor if several u have $f(u) < f(v)$?
 Termination? Correctness? Running Time?

15-853

Page20

Optimality and Reduced Cost

The **Reduced cost** for a hyperplane at a corner is the cost of moving one unit away from the plane along its corresponding edge.

For **minimization**, if all reduced cost are non-negative, then we are at an optimal solution. Finding the most negative reduced cost is one often used heuristic for choosing an edge to leave on

15-853

Page21

Reduced cost example

In the example the reduced cost of leaving the plane x_1 is $(-2, -3) \cdot (2, 1) = -7$ since moving one unit off of x_1 will move us $(2, 1)$ units along the edge. We take the dot product of this and the cost function.

15-853

Page22

Simplex Algorithm

1. Find a **corner of the feasible region**
2. **Repeat**
 - A. For each of the n hyperplanes intersecting at the corner, calculate its **reduced cost**
 - B. If they are all non-negative, then **done**
 - C. Else, pick the most negative reduced cost. This is called the **entering plane**
 - D. Move along corresponding edge (i.e. leave that hyperplane) until we reach the next corner (i.e. reach another hyperplane). The new plane is called the **departing plane**

15-853

Page23

Example

15-853

Page24

Simplifying

Problem:

- The $Ax \leq b$ constraints not symmetric with the $x \geq 0$ constraints.

We would like more symmetry.

Idea:

- Make all inequalities of the form $x \geq 0$.

Use "slack variables" to do this.

Convert into form:

$$\begin{aligned} &\text{minimize } c^T x \\ &\text{subject to } Ax = b \\ & \quad x \geq 0 \end{aligned}$$

Standard Form

$$\begin{aligned} &\text{minimize } c^T x \\ &\text{subject to } Ax \leq b \\ & \quad x \geq 0 \end{aligned}$$

slack
variables →

Standard Form

$$\begin{aligned} &\text{minimize } c'^T x' \\ &\text{subject to } A'x' = b \\ & \quad x' \geq 0 \end{aligned}$$

$|A| = m \times n$
i.e. m equations, n variables

$|A'| = m \times (m+n)$
i.e. m equations, $m+n$ variables

Example, again

minimize:

$$z = -2x_1 - 3x_2$$

subject to:

$$x_1 - 2x_2 + x_3 = 4$$

$$2x_1 + x_2 + x_4 = 18$$

$$x_2 + x_5 = 10$$

$$x_1, x_2, x_3, x_4, x_5 \geq 0$$

The equality constraints impose a 2d plane embedded in 5d space, looking at the plane gives the figure above

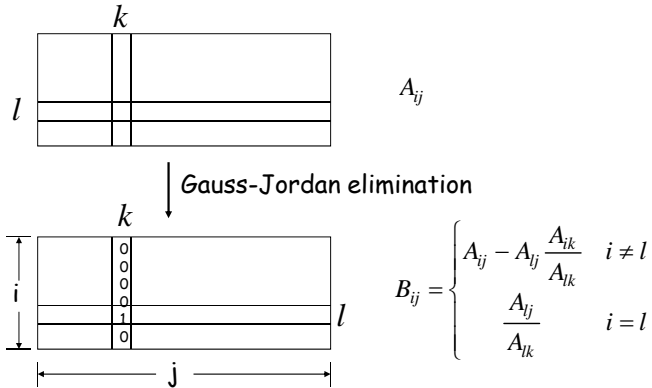

Using Matrices

If before adding the slack variables A has size $m \times n$
then after it has size $m \times (n + m)$
 m can be larger or smaller than n

$$A = \begin{array}{c|c|c} \begin{array}{cc} \leftarrow n & \leftarrow m \end{array} & \begin{array}{c} 1 \ 0 \ 0 \ \dots \\ 0 \ 1 \ 0 \ \dots \\ 0 \ 0 \ 1 \ \dots \\ \dots \end{array} & \begin{array}{c} \uparrow m \\ \downarrow m \end{array} \\ \hline & \leftarrow \text{slack vrs.} & \end{array}$$

Assuming rows are independent, the solution space of $Ax = b$ is a n dimensional subspace.

Gauss-Jordan Elimination

15-853

Page29

Simplex Algorithm, again

1. Find a **corner of the feasible region**
2. **Repeat**
 - A. For each of the n hyperplanes intersecting at the corner, calculate its **reduced cost**
 - B. If they are all non-negative, then **done**
 - C. Else, pick the most negative reduced cost. This is called the **entering plane**
 - D. Move along corresponding line (i.e. leave that hyperplane) until we reach the next corner (i.e. reach another hyperplane). The new plane is called the **departing plane**

15-853

Page30

Simplex Algorithm (Tableau Method)

This form is called a **Basic Solution**

- the n "free" variables are set to 0
- the m "basic" variables are set to b'

A valid solution to $Ax = b$ if reached using Gaussian Elimination

Represents n intersecting hyperplanes

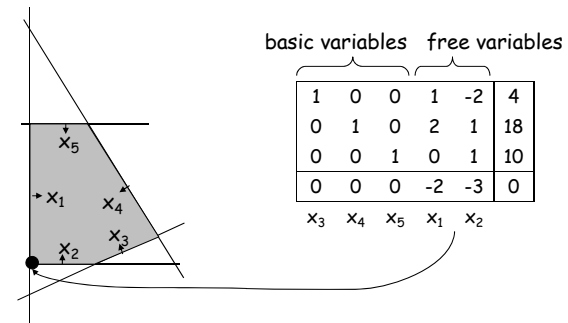

If feasible (i.e. $b' \geq 0$), then the solution is called

a **Basic Feasible Solution** and is a corner of the feasible set

15-853

Page31

Corner

15-853

Page32

Corner

| | | | | | |
|---|-------|-------|-------|-------|-------|
| 1 | 0 | 0 | -5 | -1 | -2 |
| 0 | 1 | 0 | 2.5 | 1 | 20 |
| 0 | 0 | 1 | .5 | 1 | 12 |
| 0 | 0 | 0 | -3.5 | -3 | -6 |
| | x_2 | x_4 | x_5 | x_1 | x_3 |

15-853

Page33

Corner

| | | | | | |
|---|-------|-------|-------|-------|-------|

| 0 | 1 | 0 | -2 | 5 | 10 |
| 0 | 0 | 1 | 0 | 1 | 10 |
| 0 | 0 | 0 | 2 | -7 | 8 |
| | x_1 | x_4 | x_5 | x_3 | x_2 |

15-853

Page34

Corner

| | | | | | |
|---|-------|-------|-------|-------|-------|
| 1 | 0 | 0 | .2 | .4 | 8 |
| 0 | 1 | 0 | -.4 | .2 | 2 |
| 0 | 0 | 1 | .4 | -.2 | 8 |
| 0 | 0 | 0 | -.8 | 1.4 | 22 |
| | x_1 | x_2 | x_5 | x_3 | x_4 |

15-853

Page35

Corner

| | | | | | |
|---|-------|-------|-------|-------|-------|
| 1 | 0 | 0 | .5 | -2.5 | -5 |
| 0 | 1 | 0 | .5 | .5 | 9 |
| 0 | 0 | 1 | 0 | 1 | 10 |
| 0 | 0 | 0 | 1 | -2 | 18 |
| | x_3 | x_1 | x_5 | x_4 | x_2 |

Note that in general there are $n+m$ choose m corners

15-853

Page36

Simplex Method Again

Once you have found a basic feasible solution (a corner), we can move from corner to corner by swapping columns and eliminating.

ALGORITHM

1. Find a **basic feasible solution**
2. **Repeat**
 - A. If r (reduced cost) ≥ 0 , DONE
 - B. Else, pick column with most negative r
 - C. Pick row with least positive b' /(selected column)
 - D. Swap columns
 - E. Use Gaussian elimination to restore form

15-853

Page37

Tableau Method

- A. If r are all non-negative then **done**

15-853

Page38

Tableau Method

- B. Else, pick the most negative reduced cost
This is called the **entering** plane

15-853

Page39

Tableau Method

- C. Move along corresponding line (i.e. leave that hyperplane) until we reach the next corner (i.e. reach another hyperplane)
The new plane is called the **departing** plane

15-853

Page40

Tableau Method

D. Swap columns

No longer in proper form

E. Gauss-Jordan elimination

Back to proper form

15-853

Page41

Example

| x_1 | x_2 | x_3 | x_4 | x_5 | |
|-------|-------|-------|-------|-------|----|
| 1 | -2 | 1 | 0 | 0 | 4 |
| 2 | 1 | 0 | 1 | 0 | 18 |
| 0 | 1 | 0 | 0 | 1 | 10 |
| -2 | -3 | 0 | 0 | 0 | 0 |

$$\begin{aligned} x_1 - 2x_2 + x_3 &= 4 \\ 2x_1 + x_2 + x_4 &= 18 \\ x_2 + x_5 &= 10 \\ z &= -2x_1 - 3x_2 \end{aligned}$$

Find corner

| | | | | | |
|---|---|---|----|----|----|
| 1 | 0 | 0 | 1 | -2 | 4 |
| 0 | 1 | 0 | 2 | 1 | 18 |
| 0 | 0 | 1 | 0 | 1 | 10 |
| 0 | 0 | 0 | -2 | -3 | 0 |

$x_3 \quad x_4 \quad x_5 \quad x_1 \quad x_2$

15-853 Page46

Simplex Concluding remarks

For dense matrices, takes $O(n(n+m))$ time per iteration

Can take an **exponential** number of iterations.

In practice, sparse methods are used for the iterations.

15-853 Page47

Duality

Primal (P):

$$\begin{aligned} &\text{maximize } z = c^T x \\ &\text{subject to } Ax \leq b \\ &x \geq 0 \quad (n \text{ equations, } m \text{ variables}) \end{aligned}$$

Dual (D):

$$\begin{aligned} &\text{minimize } z = y^T b \\ &\text{subject to } A^T y \geq c \\ &y \geq 0 \quad (m \text{ equations, } n \text{ variables}) \end{aligned}$$

Duality Theorem: if x is feasible for P and y is feasible for D , then $cx \leq yb$ and at optimality $cx = yb$.

15-853 Page48

Duality (cont.)

Optimal solution for both

feasible solutions for Dual (maximization) feasible solutions for Primal (minimization)

Quite similar to duality of Maximum Flow and Minimum Cut.

Useful in many situations.

15-853

Page49

Duality Example

Primal:

maximize:

$$z = 2x_1 + 3x_2$$

subject to:

$$x_1 - 2x_2 \leq 4$$

$$2x_1 + x_2 \leq 18$$

$$x_2 \leq 10$$

$$x_1, x_2 \geq 0$$

Dual:

minimize:

$$z = 4y_1 + 18y_2 + 10y_3$$

subject to:

$$y_1 + 2y_2 \geq 2$$

$$-2y_1 + y_2 + y_3 \geq 3$$

$$y_1, y_2, y_3 \geq 0$$

Solution to both is 38 ($x_1=4, x_2=10$), ($y_1=0, y_2=1, y_3=2$).

15-853

Page50
