Fiedler's Thm

Generalized Laplacians

Throughout $G=(V,E)$ unweighted & undirected

Def $Q^{n \times n}$ is a generalized Laplacian

- if:
- 1) Real symmetric
 - 2) $Q_{ij} < 0$ if $(i,j) \in E$
 - 3) $Q_{ij} = 0$ if $i \neq j$ & $(i,j) \notin E$
 - 4) Q_{ii} no constraint
-

Note $\lambda(Q)$ are real say

$$\lambda_1 \sim \lambda_n$$

$$x_1 \sim x_n$$

When needed we can set $\lambda_2 = 0$

$$\text{ie } (Q - \lambda_2 I)$$

Lemma A G connected then $\lambda_1(Q)$ is simple and eigenvector x_1 can be picked $x_1 > 0$.

pf Pick c s.t. $(-Q + cI) \geq 0$ i.e.

$$\text{Diagonal } (Q - cI) \leq 0$$

By Perron-Frobenius $\lambda_n(-Q + cI)$ is simple & can be picked positive.

Def $x: V \rightarrow \mathbb{R}$ is an valuation.

Positive support of $x = \{v \in V \mid x(v) > 0\} = \text{Supp}_+(x)$.

Negative "

" < 0 = $\text{Supp}_-(x)$.

Def Positive nodal domain \equiv

Connected component of induced subgraph on $\text{Supp}_+(x)$

Negative ND \equiv

Nodal Domain \equiv Positive or Neg ND.

Goal: Better understand ND.

EG Valuation x for P_n

Def Y is a ND of x .

$$(x_Y)_i = \begin{cases} |x_i| & \text{if } i \in Y \\ 0 & \text{o.w.} \end{cases}$$

4

Lemma $Qx = \lambda x \wedge$ Pos ND Y of X then
 $(Q - \lambda I)x_Y \leq 0$ ie $Qx_Y \leq \lambda x_Y$

pf

Write $x = \begin{pmatrix} y \\ \bar{y} \\ z \end{pmatrix} \leftarrow \begin{array}{l} V(Y) \\ \text{other Pos NDs} \\ \text{Neg NDs \& zeros} \end{array}$

Write Q as

$$\begin{pmatrix} Q_Y & A_Y & B_Y \\ \hline A_Y^T & & \\ \hline B_Y^T & & \end{pmatrix} \begin{pmatrix} y \\ \bar{y} \\ z \end{pmatrix} = \lambda \begin{pmatrix} y \\ \bar{y} \\ z \end{pmatrix}$$

Note $A_Y \equiv 0$ & $B_Y \leq 0$ & $z \leq 0$

Thus $Q_Y y + B_Y z = \lambda y$

since $B_Y z \geq 0 \Rightarrow Q_Y y \leq \lambda y$

$$A_Y^T = 0 \Rightarrow A_Y^T y = 0$$

$$B_Y^T \leq 0 \Rightarrow B_Y^T y \leq 0$$

Thus $Q \begin{pmatrix} y \\ 0 \\ 0 \end{pmatrix} \leq \lambda \begin{pmatrix} y \\ 0 \\ 0 \end{pmatrix}$

Cor $Qx = \lambda x$ & $\mathcal{U} = \{x_Y \mid Y \text{ Pos NPD of } x\}$

$$u \in \mathcal{U} \Rightarrow u^T (Q - \lambda I) u \leq 0$$

pf $u \in \mathcal{U} \Rightarrow u = \sum_{Y \in \text{PND}} \alpha_Y x_Y$

note $Y = Y' \Rightarrow x_Y^T Q x_{Y'} = 0$ & $x_Y^T x_Y = 0$

$$u^T (Q - \lambda I) u = \sum_{Y \in \text{PND}} \alpha_Y^2 x_Y^T (Q - \lambda I) x_Y \leq 0$$

Def $\text{support}(x) = \{v \mid x(v) \neq 0\}$

If $Ax = \lambda x$ then x has minimal support

if $\forall y$ s.t. $Ay = \lambda y \Rightarrow \text{support}(x) \subseteq \text{support}(y)$.

Main Thm Q gen lap of G , G connected,

$Qx = \lambda_2 x$, and x has minimal support then

$\text{supp}_+(x)$ & $\text{supp}_-(x)$ induce connected subgraphs.

pf by contradiction

Suppose $Qv = \lambda_2 v \wedge \text{PND } Y \& Z \text{ of } v$.

Lemma A $\Rightarrow \exists x > 0$ s.t. $Qx = \lambda_1 x$.

$v_Y^T v_Z = 0 \Rightarrow \dim \langle v_Y, v_Z \rangle = 2$

$\Rightarrow \exists u \in \langle v_Y, v_Z \rangle$ s.t. $u^T x = 0$

$$\text{But } u^T x = 0 \Rightarrow \frac{u^T Q u}{u^T u} \geq \lambda_2 \text{ i.e. } u^T (Q - \lambda_2 I) u \geq 0$$

$$\text{By Cor } u^T (Q - \lambda_2 I) u \leq 0$$

$$\text{Thus } u^T (Q - \lambda_2 I) x = 0$$

By Courant-Fischer

$$u^T x = 0 \text{ \& } \frac{u^T Q u}{u^T u} = \lambda_2 \Rightarrow Q u = \lambda_2 u$$

$$\text{Support}(u) = V(Y) \cup V(Z) \neq \text{Support}(v)$$

But v was minimal! contra!

Def Going from v to u we call the Fiedler Flip.

Note We can add Fiedler Flip to an iterative algorithm without increasing $\frac{v^T Q v}{v^T v}$.

Applications of ND thm.

Lemma G is a 3-connected embedded planar,

$Qx = \lambda_2 x$ Then no 3 vertices of a face are zero.

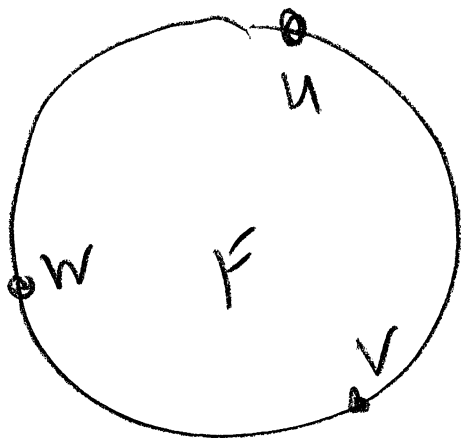

pf by contradiction.

We give idea first:

Suppose 1) $x(u) = x(v) = x(w) = 0$

2) x has minimal support

3) $p \in \text{Supp}_+(x)$ & $q \in \text{Supp}_-(x)$

By Menger's Thm

\exists 3 vertex disjoint paths from u, v, w to p

"

" q

If paths to p & to q are also disjoint then

This is $K_{3,3}$ contra!.

Full pf

Note if $x(v) = 0$ & $\exists \text{Neig}(v) = v' & x(v') > 0$
 then $\exists \text{Neig}(v) = v'' \text{ s.t. } x(v'') < 0$

pf $(\Delta x = \lambda x \Rightarrow x(v) \text{ convex comb of neigs.})$

consider vertex disj paths to P

Let u' be first $u' \in \text{Path}(u, p)$ st
 $x(u') = 0$ & $x(\text{Next}(u')) \neq 0$

P_u = path from u to u' . Sim define P_v, P_w .

Contract $\text{Supp}_+(x), \text{Supp}_-(x), P_u, P_v, P_w$
 this gives $K_{3,2}$ contra!

Cor G 3-con & planar $\Rightarrow \lambda_2(Q)$ has
 multiplicity ≤ 3 .

pf by contra!

- Suppose 1) mult ≥ 4 with ind vectors x_1, x_2, x_3, x_4 .
- 2) Vertices u, v, w on face F .

Claim $\exists x \in \lambda_2(Q), x \neq 0$, zero on u, v, w .

	x_1	x_2	x_3	x_4
u	a_1	a_2		a_4
v	b_1			
w	c_1			

$$\begin{pmatrix} d_1 \\ \vdots \\ d_4 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$\exists d \neq 0$ contra!

Lemma G is 2-con embedded planar graph \wedge
 $Qx = \lambda_2 X \wedge x$ of minimal support if $(u, v) \in E$ of
 Face F s.t $x(u) = x(v) = 0$ then $x(F) \geq 0$ or $x(F) \leq 0$.

pf G 2-con $\Rightarrow F$ is a simple cycle

Assume $(u, v) \in E \subseteq F$ & $x(u) = x(v) = 0$

add $\exists p, q \in F$ s.t $x(p) > 0$ & $x(q) < 0$

Interval $\langle u', v' \rangle$ is a maximal
 zero interval of x

u', v' have both pos & neg neigh.

Case 1 $x(s) > 0$ $x(t) < 0$

Case 1

Claim \exists subpaths of P_+, P_- disjoint from F that "interlace".

Thus
new
vertex

This is K_5 a contra!

Case 2 similar.

Cor G is 2-conn & outerplanar then
 $\text{mult}(\lambda_2(Q)) \leq 2$.

pf by contra.

Assuming $\text{mult} \geq 3$ then $\exists x \in \lambda_2(Q)$

$$\text{st } x(u) = x(v) = 0$$

$$\Rightarrow x \geq 0 \text{ \& } x^T x_1 = 0 \text{ contra!}$$
