

# Sticky Finger Manipulation With a Multi-Touch Interface

Ken Toh MS Thesis

# Motivation

- User interaction is a key feature in most graphical and robotic applications.

Manipulating virtual cloth

Teleoperating a robot with a multi-fingered hand

# Motivation

- Traditional User Input Devices are effective for many simple high-level interaction tasks..

On/off

Up, down, left, right

Common user input devices with simple command spaces

# Motivation

- *Dexterous manipulation* of simulated/real world objects with **high DOFs** can however be quite awkward to achieve with these existing input devices

Realistic cloth tearing requires more than a single cursor to execute

A panel of buttons is not the most intuitive interface for dexterous tele-manipulation

# Motivation

- **Key Question:**

Can we design an *intuitive* user interface that allows us to feel natural when manipulating objects by proxy, almost as though we are interacting with them directly?

# Cloth Manipulation: Modes

Creation Mode

Sticky-Finger Mode

Cut Mode

# Sticky Fingers for Cloth Manipulation

Underlying cloth particles within radius of each active fingertip center are stuck to that finger and moves with it

# Sticky-finger Lifting

- User activates toggle which changes the plane of control from the **x-z** plane to **x-y** plane.

# Pinch-lifting

- Automatic detection of pinch event when two finger touches are close together.

# Cloth Simulation Model

A mesh of particles connected by **bend**, **shear** and stretch constraints

# Verlet Integration

- **Key:** Position-based dynamics essential because we need to stick particles kinematically to fingers (ie. modify positions directly)

$$\mathbf{x}_{new} = 2\mathbf{x}_{cur} - \mathbf{x}_{old} + \mathbf{a}\Delta t^2$$

$$\mathbf{x}_{old} = \mathbf{x}_{cur}$$

# Iterative Constraint Satisfaction

- Must handle cases with stuck fingers

$$\Delta \mathbf{x}_2 = -\Delta \mathbf{x}_1$$

$$\Delta \mathbf{x}_1 = \frac{1}{2} \left( |\mathbf{x}_2 - \mathbf{x}_1| - r \right) \frac{\mathbf{x}_2 - \mathbf{x}_1}{|\mathbf{x}_2 - \mathbf{x}_1|}$$

Correction vector

Case (a):  $\mathbf{x}_1$  and  $\mathbf{x}_2$  not stuck

$$\Delta \mathbf{x}_1 = 0$$

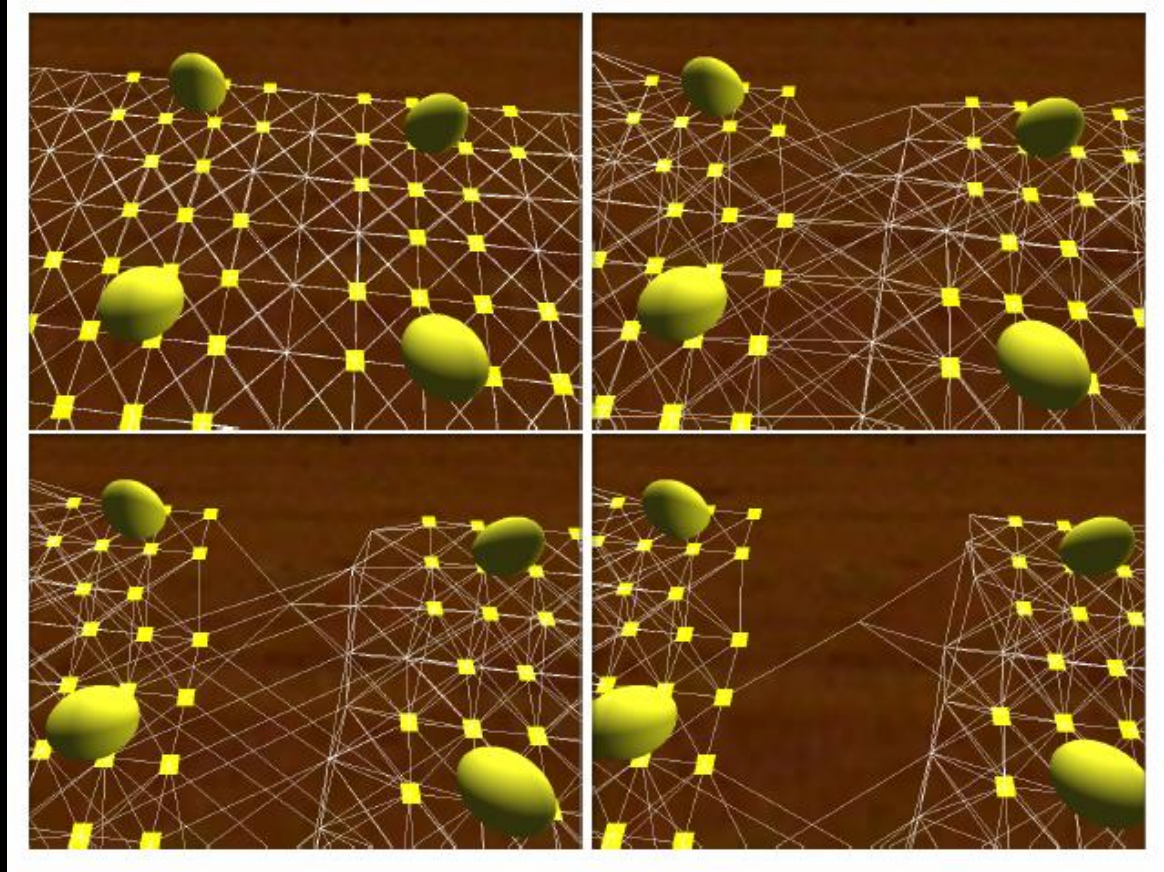

$$\Delta \mathbf{x}_2 = - \left( |\mathbf{x}_2 - \mathbf{x}_1| - r \right) \frac{\mathbf{x}_2 - \mathbf{x}_1}{|\mathbf{x}_2 - \mathbf{x}_1|}$$

Case (b):  $\mathbf{x}_1$  stuck,  $\mathbf{x}_2$  not stuck

Case (c): if both are stuck, both = 0

# Tearing

- Sticky finger pins down relevant particles and constraints, allowing unconstrained regions to elongate and eventually tear. Finger size matters too.

# Cutting

Similar to tearing but in a more controlled fashion

# Direct Cloth Manipulation

Interactive Cloth Manipulation With Multi-Touch Control

---
