

# Filtering vs Convolution

16-385 Computer Vision

# Filters we have learned so far ...

The 'Box' filter

$$\frac{1}{9} \begin{array}{|c|c|c|} \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline 1 & 1 & 1 \\ \hline \end{array}$$

Gaussian filter

$$\frac{1}{16} \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 2 & 4 & 2 \\ \hline 1 & 2 & 1 \\ \hline \end{array}$$

Sobel filter

$$\begin{array}{|c|c|c|} \hline 1 & 0 & -1 \\ \hline 2 & 0 & -2 \\ \hline 1 & 0 & -1 \\ \hline \end{array}$$

Laplace filter

$$\begin{array}{|c|c|c|} \hline 0 & 1 & 0 \\ \hline 1 & -4 & 1 \\ \hline 0 & 1 & 0 \\ \hline \end{array}$$

# Filtering vs Convolution

**filtering**  
(cross-correlation)

$$h = g \otimes f$$

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output                      filter                      image

What's the  
difference?

**convolution**

$$h = g \star f$$

$$h[m, n] = \sum_{k, l} g[k, l] f[m - k, n - l]$$

# Filtering vs Convolution

**filtering**  
(cross-correlation)

$$h = g \otimes f$$

$$h[m, n] = \sum_{k, l} g[k, l] f[m + k, n + l]$$

output                      filter                      image

filter flipped  
vertically and  
horizontally

**convolution**

$$h = g \star f$$

$$h[m, n] = \sum_{k, l} g[k, l] f[m - k, n - l]$$

# Filtering vs Convolution

**filtering**  
(cross-correlation)

$$h = g \otimes f$$

$$h[m, n] = \sum_{k, l} \overset{\text{filter}}{g[k, l]} \overset{\text{image}}{f[m + k, n + l]}$$

filter flipped  
vertically and  
horizontally

**convolution**

$$h = g \star f$$

$$h[m, n] = \sum_{k, l} g[k, l] f[m - k, n - l]$$

*Suppose  $g$  is a Gaussian filter.  
How does convolution differ from filtering?*

Recall...

1	2	1
2	4	2
1	2	1

$\frac{1}{16}$

**Commutative**

$$a \star b = b \star a .$$

**Associative**

$$(((a \star b_1) \star b_2) \star b_3) = a \star (b_1 \star b_2 \star b_3)$$

**Distributes over addition**

$$a \star (b + c) = (a \star b) + (a \star c)$$

**Scalars factor out**

$$\lambda a \star b = a \star \lambda b = \lambda(a \star b)$$

**Derivative Theorem of Convolution**

$$\frac{\partial}{\partial x}(h \star f) = \left(\frac{\partial}{\partial x}h\right) \star f$$

can precompute this

Derivative Theorem of Convolution  $\frac{\partial}{\partial x}(h \star f) = \left(\frac{\partial}{\partial x}h\right) \star f$

Sigma = 50

Input

Derivative of  
Gaussian

$$\frac{\partial}{\partial x}h$$

Output

$$\left(\frac{\partial}{\partial x}h\right) \star f$$

# Recall ...
