# **Error Handling**

#### Three kinds of error

- Hmm...
- That's not right...
- Uh-oh...

Important to classify & react appropriately

- 2 - 15-410, F'06

```
Improve memory locality:
// store players in array
struct player players[MAX];
struct player *new_player(int team, int num)
  int i;
  if ((i = emptyslot()) == -1)
    /* OH NO!!! */
    MAGIC_BREAK;
                                           15-410, F'06
```

```
Improve memory locality:
// store players in array
struct player players[MAX];
struct player *new_player(int team, int num)
  int i;
  if ((i = emptyslot()) == -1)
    /* OH NO!!! */
    while(1);
                                           15-410, F'06
```

# What's Going On?

### "Out of table slots" - what kind of thing?

- Should really never happen?
- Might happen sometimes?
- Likely to happen once a day?
  - Remember: users always want 110%!

#### What to do?

- Resolve reasonable issues when possible
  - How to resolve this one?

- 5 - 15-410, F'06

```
struct player *players;
int playerslots;
struct player *new_player(int team, int num)
  int i;
  if ((i = emptyslot()) == -1)
    if ((i = grow_table_and_alloc()) == -1)
      /* OH NO!!! */
      while(1);
                                           15-410, F'06
```

# What's Going On?

### "Out of heap space" - what kind of thing?

- Should really never happen?
- Might happen sometimes?
- Likely to happen once a day?

- 7 -

# What's Going On?

### "Out of heap space" - what kind of thing?

- Should really never happen?
- Might happen sometimes?
- Likely to happen once a day?

### My suggestion

"Might happen sometimes"

#### What to do?

- Hard to say what the right thing is for all clients
  - Is it fatal or not?
- Often: pass the buck

- 8 - 15-410, F'06

```
struct player *players;
int playerslots;
struct player *new_player(int team, int num)
  int i;
  if ((i = emptyslot()) == -1)
    if ((i = grow_table_and_alloc()) == -1)
      return (NULL);
```

- 9 - 15-410, F'06

### "Free Player" - Take 1

```
void free_player(struct player *p)
  switch(player->role) {
  case CONTENDER:
    free(p->cstate); break;
  case REFEREE:
    free(p->refstate); break;
  free(p->generic);
  mark_slot_available(p - players);
```

- 10 -

### What's Wrong?

### There is a sanity-check missing...

- Probably somebody will make a mistake eventually
- Let's catch it

- 11 -

# "Free Player" - Take 2

```
void free_player(struct player *p)
  switch(player->role) {
  case CONTENDER:
    free(p->cstate); break;
  case REFEREE:
    free(p->refstate); break;
  default: return;
  free(p->generic);
  mark_slot_available(p - players);
- 12 -
```

### All Fixed?

#### No!

- The program has a bug
  - Maybe the client is passing us random player pointers
  - Maybe we are handing out invalid p->role values
- We happened to catch the bug this time
- We might not catch it every time!
  - A random player pointer might have a "valid" p->role

### The program is broken

- Hiding the problem isn't our job
- Hiding the problem isn't even defensible

- 13 -

### Should We "Crash"?

### If the program is "broken", should we "crash"?

- Often: yes
  - Dumping core allows debugger inspection of the problem
  - Throwing running program into a debugger is probably nicer

- 14 -

# **Summary**

#### Three kinds of error

- Hmm...
  - Try to resolve
- That's not right...
  - Try to report
- Uh-oh...
  - Try to help the developer find the problem faster

- 15 - 15-410, F'06
