

15-410

*“...This is a **transformative** class...”*

Review
Dec. 7, 2007

Dave Eckhardt

Roger Dannenberg

Synchronization

Time is running out

Synchronization

Time is running out

- <http://www.cmu.edu/uca>

Synchronization

The end is nigh

Synchronization

The end is nigh

- But you can take 15-610 in the spring
 - <http://www.cs.cmu.edu/~15-610/>
 - Questions? satya@cs
- And/or 15-412 in the fall
 - <http://www.cs.cmu.edu/~412>
 - Questions? Eckhardt
- We also have a nice database class, 15-415
 - More concurrency, more lock types
 - Write-ahead logging

Synchronization

Homework 2 due tonight

- Solutions will be released “immediately”
- $\Rightarrow$ No late days

Book report due tonight

Exam Thursday

- <http://www.cmu.edu/hub/current-finals.pdf>
- Note that there was a room change!

Synchronization

P3 grading guidance reminder

- **Weights are approximate**

~50% shell works (w/o horrible hacks)

~30% tests

- **10% basic**
- **15% stress, trickiness, argument verification**
- **5% threads**

~10% structure/style

~10% concurrency (preemption, locking, synch)

Synchronization

Exam will be closed-book

- *But you may bring a 1-sided 8.5x11 sheet of notes*
 - WRITTEN BY YOU IN YOUR OWN HAND
 - WRITTEN BY YOU IN YOUR OWN HAND
- *Weakly* non-cumulative
 - Emphasis on new material, design questions
 - You will need to use some “old” knowledge
 - We didn't really test on “P2 knowledge” (nor P3)
 - Recall: VM was off-limits on mid-term (and you've done it)
- Mixture of fact/concept testing and *design*

Synchronization

About today's “review”

- More “reminders” than “course outline”
 - Un-mentioned topic implies “text & lectures straightforward”
- Reading *some* of the textbook is advisable!

Read Your Code

Re-read your P2

Re-read your P3

Go over feedback

Talk about them with your partner

- Schedule a time

You should understand “the hard parts”

- Focus on whichever part you know least well
 - (or fear the most)

“Concept” Lectures

We could ask a question...

- ...we would give you guidance/refresh your memory

Examples

- Plan 9
- Lock-free programming
- Transactions
- OS Structure

Core “Phase I” concepts

Machine model

- Registers
 - “regular”
 - “special”
- Interrupt (vs. exception –how they differ, why)

Process model

- You should be a memory-map *expert*
 - Kernel space, user space, virtual memory
- Process vs. thread
- *Exactly* what goes on a stack, where it comes from...

Core “Phase I” concepts

Mutual exclusion

- mutex, cvar, what's inside, why

Concurrency

- Race-condition expert!
- Be able to explain one to your nephew
 - (the one you'll visit over break)

Deadlock

- Ingredients
- Various approaches to coping

Virtual Memory

The Game

- Maintain multiple illusions (aka “address spaces”)

Players

- High-level info (what uses which regions, COW/ZFOD)
- Mapping data structure (typically set by processor)
- TLB –cache of v-to-p translations from that data structure
 - “flush” - when, why, how?

Behavior of the Players

- Mappings are *sparse*
- This explains the ways they're implemented

Scheduling

Round-Robin

Things people do

- Multi-level feedback queues

Be careful!

- Priority

Real-time scheduling

- Schedulability
- “Priority inversion”
- “Priority inheritance”

Disk scheduling

Spinning platter/waving arm model

Seek time vs. rotational latency

**FCFS, SSTF, SCAN, LOOK, C-SCAN, C-LOOK, SPTF,
WSPTF**

Fairness, mean response time, variance, starvation

Disk Array Overview

Historical practices

- Striping, mirroring

The reliability problem

- More disks $\Rightarrow$ *frequent* array failures
- *Cannot* tolerate $1/N$ reliability

Parity, ECC, why parity is enough

- Erasure channels
 - Good terminology to display at parties

Disk Array Overview

RAID “levels” (really: flavors)

- Understand RAID 0, 1, 4 vs. 5
- What they're good for, why

File Systems

Data access model

- What it means for a file to be “open”

Cache issues

Naming

- Directory flavors, mounting

Core problem: block mapping

- Compare data structures to VM
- “Holes”

Architecture

- Layering to support multiple file system types, ...

IPC

Communicating process on one machine

Naming

- Name server?
- File system?

Message structure

- Sender id, priority, type
- Capabilities: memory region, IPC rights

Synchronization/queueing/blocking

IPC

Group receive

Copy/share/transfer

A Unix surprise

- `sendmsg()/recvmsg()` pass file descriptors!

RPC Overview

RPC = Remote Procedure Call

Extends IPC in two ways

- **IPC = Inter-Process Communication**
 - **OS-level: bytes, not objects**
- **IPC restricted to single machine**

Marshalling

Server location

RPC Overview

Call semantics

- Asynch? Batch? Net/server failure?

Client flow, server flow

- Client stub routines, server dispatch skeleton

Java RMI

- (have some sense - obviously, we didn't make you use it)

Marshalling

Values must cross the network

Machine formats differ

- Serialize/de-serialize
- Format/packing
- Type mismatch issues

“The pointer problem”

Distributed File Systems

Client-side redirection

- Which files are remote? How to operate remotely?

Communication

- RPC, XDR
- Flow of RPC operations to access a file
 - Mount, lookup, access
- Batching (what, why)
- Cache vs. consistency vs. locks

Protection Overview

Protection vs. Security

- Inside vs. outside “the box”

Objects, operations, domains

Access control (*least privilege*)

3 domain models

Domain switch (setuid example)

Multics ring architecture

Access Matrix

- Concept and real-world approaches

Security Overview

Goal / Threat / Response tuples

Malware

- Trojans, trapdoors
- Buffer overflow
- Viruses, worms

Password files, salt

- What is the threat, how does the technique help

Biometrics vs. cheating

Security Overview

“Understand cryptography”

- What **secure** hashing is good for
- One-time pad
- Symmetric (private-key) crypto
 - Small, “password-like” keys
- Asymmetric (public-key) crypto
 - Has private keys and public keys
 - And, in practice, symmetric session keys –know how/why
- The mysterious nonce
- Kerberos
 - Symmetric crypto
 - Central server avoids the n^2 key problem

Transactions

Basic concept

- ACID properties
- Begin/Commit/Roll-back

Write-ahead logging

- Why it works
- Value logging (ok to skip operation logging)
- Crash-restart processing (undo/re-do)

Preparation Suggestions

Sleep well (**two** nights)

Scan lecture notes

Read any skipped textbook sections

- Well, the most-important ones, anyway

Understand the code you turned in

- Even what your partner wrote
- What are the hard issues, why?

Preparation Suggestions

Prepare a sheet of notes

Read comp.risks & Effective Java

- Ok, after the exam will suffice

Don't panic!

- Budget time wisely during exam
 - (don't get bogged down on one question)

15-410 on One Slide

What a process/thread *really is*

- (the novel-length version, not the fairy tale)

Concurrency & synchronization

- Issues, mechanisms, *hazards*

How the pieces of hardware fit together

- ...to make a “system” which can run “programs”

A sense of “what's out there” beyond the kernel

Skills for non-small software artifacts

- Design, debugging, partnering
- Documenting, source control

Closing Thought

To understand a program you must become both the machine and the program.

-Alan Perlis
