15-410 "...RADIX-50??..."

File System (Interface) Mar. 29, 2004

Dave Eckhardt
Bruce Maggs

- 1 - L25\_Filesystem 15-410, S'04

# **Synchronization**

### **Checkpoint 3**

- Due midnight tonight
- Summary "Where are you now, where will you be"
- Details announce bboard

## **Today**

- Chapter 11, File system interface
  - Ok to skip: remote/distributed (11.5.2!!)

## **Don't forget about Chapter 13**

Reviewing might help demystify readline() some

## Don't forget about reading schedule on web site

- 2 - 15-410, S'04

# **Synchronization**

### Two interesting papers about disks

- http://www.seagate.com/content/docs/pdf/whitepaper/D2c
   \_More\_than\_Interface\_ATA\_vs\_SCSI\_042003.pdf
- Google for "200 ways to revive a hard drive"

- 3 -

## What's a file?

### Abstraction of persistent storage

- Hide details of storage devices
  - sector addressing: CHS vs. LBA
  - SCSI vs. IDE
- Hide details of allocation/location on a storage device

## **Logical** grouping of data

May be physically scattered

## Programs, data

### Some internal structure

- 4 - 15-410, S'04

# Typical file attributes

Name - 14? 8.3? 255?

• Unicode? ASCII? 6-bit? RADIX-50?

**Identifier - "file number"** 

Type (or not)

Location – device, block list

Size – real or otherwise

Protection – Who can do what?

Time, date, last modifier – monitoring, curiousity

- 5 -

# "Extended" file attributes

### **BSD Unix**

- archived
- nodump
- append-only (by user/by operating system)
- immutable (by user/by operating system)

### **MacOS**

• icon color

- 6 -

# **Operations on Files**

**Create – locate space, enter into directory** 

Write, Read – according to position pointer/cursor

Seek – adjust position pointer

Delete – remove from directory, release space

#### **Truncate**

- Trim data from end
- Often all of it

### Append, Rename

- 7 - 15-410, S'04

# **Open-file State**

## Expensive to specify name for each read()/write()

- String-based operation
- Directory look-up

## "Open-file" structure stores

- File-system / partition
- File-system-relative file number
- Read vs. write
- Cursor position

- 8 -

# **Open files (Unix Model)**

#### "In-core" file state

- Mirror of on-disk structure
  - File number, size, permissions, modification time, ...
- Housekeeping info
  - Back pointer to enclosing file system
  - Pointer to disk device hosting the file
  - Who holds locks on ranges of file
- How to access file (vector of methods)
- Pointer to file's type-specific data

## **Shared** when file is opened multiple times

- 9 - 15-410, S'04

# **Open files (Unix Model)**

## "Open file" state (result of one open() call)

- Access mode (read vs. write, auto-append, ...)
- Credentials of process (when it opened the file)
- Cursor position
- Pointer to underlying "open file"

## **Shared** by multiple processes

- "copied" by fork()
- inherited across exec()

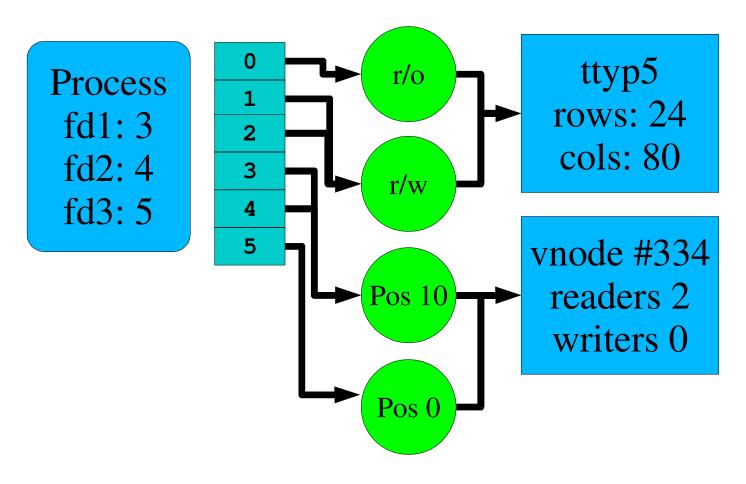

- 10 -

# **Example**

- 11 -

```
int fd1, fd2, fd3;
off_t pos2, pos3;
char buf[10];
fd1 = open("foo.c", O_RDONLY, 0);
fd2 = dup(fd1);
fd3 = open("foo.c", O_RDONLY, 0);
read(fd1, &buf, sizeof (buf));
pos2 = lseek(fd2, OL, SEEK_CUR); /*10*/
pos3 = lseek(fd3, OL, SEEK_CUR); /*0*/
                                      15-410, S'04
```

# "Open File" vs. "In-Core File"

- 12 -

# File types (or not)

### Goal

- Avoid printing a binary executable file
- Find program which "understands" a file

#### Filter file names

\*.exe are executable, \*.c are C

### Tag file

MacOS: 4-byte type, 4-byte creator

## Unix: Both/neither - Leave it (mostly) up to users

- 13 -

## File Structure

#### What's in a file?

- Stream of bytes?
  - What character set? US-ASCII? Roman-1? Unicode?
- Stream of records?
- Array of records? Tree of records?

### **Record structure?**

- End of "line"
  - CR, LF, CR+LF
- Fixed-length? Varying? Bounded?

- 14 - 15-410, S'04

# File Structure - Unix

#### OS needs to know about executables

- "Magic numbers" in first two bytes
  - obsolete A.OUT types OMAGIC, NMAGIC, ZMAGIC
  - ELF
  - #! script

### Otherwise, array of bytes

User/application remembers meaning (hopefully!)

### For a good time,

- Try the "file" command
- Read /usr/share/magic
  - Marvel at the dedication of the masses

- 15 -

# File Structure – MacOS

#### **Data fork**

- Array of bytes
- Application-dependent structure

#### **Resource fork**

- Table of resources
  - Icon, Menu, Window, Dialog box
- Many resources are widely used & understood
  - Desktop program displays icons from resource fork

- 16 -

# **Access Methods**

### Provided by OS or optional program library

### **Sequential**

- Like a tape
- read() next, write() next, rewind()
- Sometimes: skip forward/backward

#### **Direct/relative**

- Array of fixed-size records
- Read/write any record, by #

- 17 -

# Access Methods – Indexed

File contains records

Records contain keys

*Index* maps keys ⇒ records

- Sort data portion by key
- Binary search in multi-level list

### **Fancy extensions**

- Multiple keys, multiple indices
- Are we having a database yet?
- Unix equivalent: dbm/ndbm/gdbm/bdb/...

- 18 -

# **Directory Operations**

Lookup("index.html")

Create("index.html")

Delete("index.html")

Rename("index.html", "index.html~");

Iterate over directory contents

Scan file system

- Unix "find" command
- Backup program

- 19 -

# **Directory Types**

### Single-level

- Flat global namespace only one test.c
- Ok for floppy disks (maybe)

#### **Two-level**

- Every user has a directory
- One test.c per user
  - [1003,221]PROFILE.CMD vs. [1207,438]PROFILE.CMD
- Typical of early timesharing

### Are we having fun yet?

- 20 - 15-410, S'04

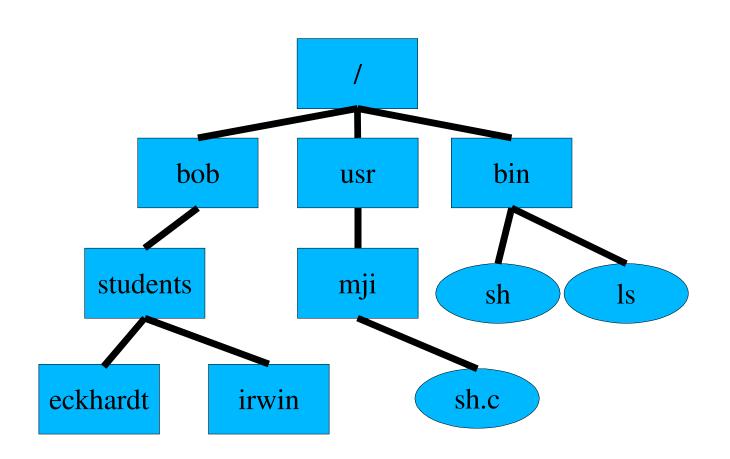

## **Tree Directories**

### Absolute Pathname

- Sequence of directory names
- Starting from "root"
- Ending with a file name

- 21 - 15-410, S'04

# **Tree Directories**

- 22 -

# **Tree Directories**

### Directories are special files

- Created with special system calls mkdir()
- Format understood, maintained by OS

## **Current directory (".")**

- "Where I am now"
- Start of *relative* pathname
  - ./stuff/foo.c aka stuff/foo.c
  - ../joe/foo.c aka /usr/joe/foo.c

- 23 - 15-410, S'04

# **DAG** Directories

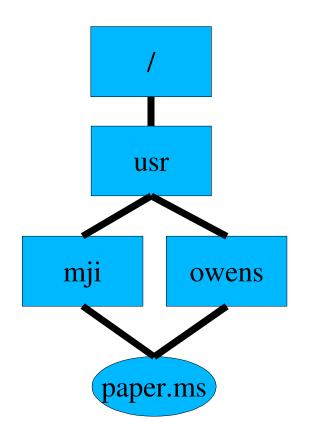

Share files and directories between users

Not mine, not yours: ours

Destroy when everybody deletes

Unix "hard link"

- Files, not directories
  - (".. problem")

- 24 - 15-410, S'04

# Soft links

#### Hard links "too hard"?

- Need a level of indirection in file system?
- No "one true name" for a file
- NIH syndrome?

## Soft link / symbolic link / "short cut"

- Tiny file, special type
- Contains name of another file
- OS dereferences link when you open() it

- 25 - 15-410, S'04

# Hard vs. Soft Links

#### **Hard links**

- Enable reference-counted sharing
- No name is "better" than another

#### Soft links

- Can soft-link a directory
  - one "true" parent, so no ".. problem"
- Work across file system & machine boundaries
- Easier to explain
- "Dangling link" problem
  - Owner of "one true file" can delete it
  - Soft links now point to nothing

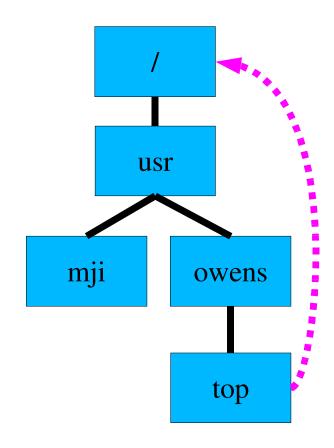

- 26 - 15-410, S'04

# **Graph Directories**

Depth-first traversal can be slow!

May need *real* garbage collection

Do we really need this?

- 27 - 15-410, S'04

# **Mounting**

Multiple disks on machine

**Multiple partitions on disk** 

File system within a partition

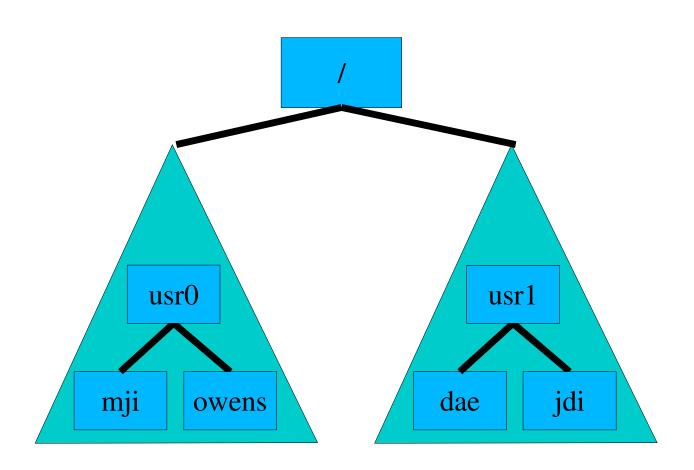

Or, within a volume / logical volume / ...

## How to name files in "another" file system?

- Wrong way
  - C:\temp vs. D:\temp
  - [1003,221]PROFILE.CMD vs. [1207,438]PROFILE.CMD

- 28 - 15-410, S'04

# **Mounting**

- 29 -

# **Multiple Users**

### **Users want to share files**

#### What's a user?

- Strings can be cumbersome
- Integers are nicer for OS to compare
- Unix: User ID / "uid"
- Windows: Security ID / "SID"

## What's a group?

- A set of users
- Typically has its own gid / SID

- 30 -

## **Protection**

## Override bit (e.g., MS-DOG)

- Bit says "don't delete this file"
  - Unless I clear the bit

### **Per-file passwords**

Annoying in a hurry

## **Per-directory passwords**

Still annoying

- 31 -

## **Protection**

#### **Access modes**

Read, Write, Execute, Append, Delete, List, Lock, ...

## **Access Control List (ACL)**

- File stores list of (user, modes) tuples
- Cumbersome to store, view, manage

## **Capability system**

- User is given a list of (file, access keys) tuples
- Revocation problem

- 32 -

# Protection – typical

### File specifies owner, group

- Permissions for owner, permissions for group members
  - Read, write, ...
- Permissions for "other" / "world"
  - Read, write, ...

### Unix

- r, w, x = 4, 2, 1
- rwxr-x—x = 0751 (octal)
- V7 Unix: 3 16-bit words specified all permission info
  - permission bits, user #, group #
    - » Andrew's /etc/passwd has 39,941 users...

- 33 -

# Summary

### File

- Abstraction of disk/tape storage
  - Records, not sectors
  - Type information
- Naming
  - Complexity due to linking
- Ownership, permissions
- Semantics of multiple open()s

Extra details in 20.7, 20.8

- 34 -
