“Experience is what you get... ...when you don't get what you want.”

Debugging
Jan. 28, 2019

Dave Eckhardt
Brian Railing
What is “Debugging”?
What is “Debugging”?

Debugging is resolving a clash between stories
What is “Debugging”?  

**Debugging is resolving a clash between stories**  
- Your hopeful story of achievement  
- The world's sad tale of woe  

**The stories look alike!**  
- At the beginning, they both start with main()...  
- Key step: finding the divergence  

**Stories are fractal**  
- You can zoom in on them and get more detail each time  
- The divergence is typically a tiny detail  
  - You will need to zoom in quite a lot
Move Beyond “Plot Summaries”

“When I install my keyboard handler it crashes”
  - Insufficient detail
  - This is a “plot summary”, not a tale of woe
  - Don't ask us to look at your code yet!

Deepen your level of detail
  - What was your story of hope, in detail?
  - What parts of your story already happened?
Telling Your Story

“When I install my keyboard handler…”
  - What do you really hope?
Telling Your Story

“When I install my keyboard handler…”

- What do you really hope?
  - Hardware notices key press/release
  - Hardware posts interrupt
  - CPU recognizes interrupt as keyboard interrupt
  - CPU responds to (vs. ignores) keyboard interrupt
  - CPU stores trap frame
  - CPU vectors through your IDT entry
  - Your wrapper is run
  - Wrapper calls C code
  - C code does ...
Pinpointing Depends on the Story

“...it crashes”

- Ok, that's generally what programs do
- Or, at least, that's when we start to pay attention to them...
Pinpointing Depends on the Story

“...it crashes”
- Ok, that's generally what programs do
- Or, at least, that's when we start to pay attention to them...

The critical question
- How far did your story progress before the crash?
Pinpointing Depends on the Story

“...it crashes”
- Ok, that's generally what programs do
- Or, at least, that's when we start to pay attention to them...

The critical question
- How far did your story progress before the crash?

Pinpointing the problem
- How can you measure which steps worked ok?
  - “Keypress $\Rightarrow$ crash” tells you quite a bit!
Matching Phenomena to the Story

“Keypress ⇒ crash” tells you quite a bit

✔ Hardware notices keyboard event
✔ Hardware posts interrupt
✔ CPU recognizes interrupt as keyboard interrupt
✔ CPU responds to (vs. ignores) keyboard interrupt
?
  ? CPU stores trap frame
?
  ? CPU vectors through your IDT entry
?
  ? Your wrapper is run
?
  ? Wrapper calls C code
?
  ? C code does ...

What now?
Measuring

How can you measure the other steps?

? CPU stores trap frame
? CPU vectors through your IDT entry
? Your wrapper is run
? Wrapper calls C code
? C code does ...
Measurement Techniques

“Obvious”
- printf()
- single-step the program

Moving beyond the obvious
- Know your debugger
  - breakpoints, watchpoints
- Those pesky registers
  - %ESP, %EIP – these should *always* “make sense”
    » You should always know what would be “sensible”!
  - %CS, %DS, %SS – not all *that* many legal values, right?
  - %EFLAGS, %CR0 – “when the going gets tough...”
Measurement Techniques

**Writing code**
- Breakage of a complex data structure is, well complex
- Probably need code to check invariants
  - Doing it by hand is fun at most once
Asking for Help

“Plot summary” is not enough
- We probably have no idea what's wrong
  - Really!
  - Please see “triple fault” web page

You should always have a measurement plan
- What is the next thing to measure?
- How would I measure it?

You may reach the end of your rope
- Some things are genuinely tricky to debug
- Things in this class may occasionally qualify
  - This is a good learning experience
Asking for Help

When are you ready to ask for help?

- You have a long, detailed story – this is critical!!!
  - Based on lecture, handout, Intel docs
  - “Story” often needs one or two pictures
- Parts of the story are clearly happening
  - You have straightforward evidence, you are confident
- You have a measurement problem
  - Too many things to measure?
  - No idea how to measure one complicated thing?
  - Measurement results “make no sense”?
Summary

Debugging is about reconciling two stories
- “Plot summaries” aren't stories (you must zoom in)
- “If you don't know where you are going, you will wind up somewhere else.” — Yogi Berra

Measure multiple things, use multiple mechanisms
You should “always” have a next measurement target
When you see us, bring a long story
- ...which you will naturally be an expert on the first part of
- Try to know why each register has the value it does
