Parallelism for the Masses:
Opportunities and Challenges
Outline

- Is Parallelism a crisis?
- Opportunities in Parallelism
- Expectations and Challenges
- Moving Parallel Programming Forward
- What’s Going on at Intel
- Questions
Parallelism is here... And Growing!

Number of Cores

2006  2007  2008  2009  2010  ...  2015

Core 2 Duo (2)
Core2 Quad (4)
Dunnington (6)
Nehalem: 8+
Larrabee: 12-32
Future: 100+
Q. Is parallelism a crisis?

A. Parallelism is an opportunity.
Parallelism is a key driver for Energy and Performance

- **Over-clocked (+20%)**
  - Dual-Core: 1.13x
  - Performance: 1.73x
  - Power: 1.00x

- **Design Frequency**
  - Dual-Core: 0.87x
  - Performance: 1.73x
  - Power: 0.51x

- **Dual-core Underclocked (-20%)**
  - Dual-Core: 1.02x
  - Performance: 1.73x
  - Power: 0.51x

Parallelism for the Masses

"Opportunities and Challenges"
Opportunity #1: Highly Portable, Parallel Software

- All computing systems (servers, desktops, laptops, MIDs, smart phones, embedded…) converging to...
  - A single framework with parallelism and a selection of CPU’s and specialized elements
  - Energy efficiency and Performance are core drivers
  - Must become “forward scalable”

Parallelism becomes widespread – all software is parallel

Create standard models of parallelism in architecture, expression, and implementation.
Software with **forward scalability** can be moved unchanged from $N \rightarrow 2N \rightarrow 4N$ cores with continued performance increases.
Opportunity #2: Major Architectural Support for Programmability

- Single core growth and aggressive frequency scaling are weakening competitors to other types of architecture innovation

Architecture innovations for functionality – programmability, observability, GC, ... are now possible

Don’t ask for small incremental changes, be bold and ask for LARGE changes... that make a LARGE difference
New Golden Age of Architectural Support for Programming?

- Language Support Integration
- Ghz Scaling Issue Scaling
- Programming Support Parallelism System Integration

Mid 60’s To Mid 80’s
Mid 80’s To Mid 200x
Terascale Era

Parallelism for the Masses
"Opportunities and Challenges"
Opportunity #3: High Performance, High Level Programming Approaches

- Single chip integration enables closer coupling (cores, caches) and innovation in intercore coordination
  - Eases performance concerns
  - Supports irregular, unstructured parallelism

Forward scalable performance with good efficiency may be possible without detailed control.

Functional, declarative, transactional, object-oriented, dynamic, scripting, and many other high level models will thrive.
Parallelism for the Masses

"Opportunities and Challenges"

• Less locality sensitive; Efficient sharing
• Runtime techniques more effective for dynamic, irregular data and programs

• Can we do less tuning? And program at a higher level?

<table>
<thead>
<tr>
<th>Parameter</th>
<th>SMP</th>
<th>Tera-scale</th>
<th>Improvement</th>
</tr>
</thead>
<tbody>
<tr>
<td>On-die Bandwidth</td>
<td>12 GB/s</td>
<td>~1.2 TB/s</td>
<td>~100X</td>
</tr>
<tr>
<td>On-die Latency</td>
<td>400 cycles</td>
<td>20 cycles</td>
<td>~20X</td>
</tr>
</tbody>
</table>
Opportunity #4: Parallelism can Add New Kinds of Capability and Value

• Additional core and computational capability can be available on-chip
  – Single-chip design enables enhancement at low cost
  – Integration enables close coupling
  – Security: taintcheck, invariant monitoring, etc.
  – Robustness: race detection, invariant checking, etc.
  – Interface: sensor data processing, self-tuning, activity inference

Deploy Parallelism to enable new applications, software quality, and enhance user experience
Expectations and Challenges
Two Students in 2015

Mine’s an Intel 1,000 core with 64 Out-of-Order cores!

How many cores does your computer have?

End Users don’t care about core counts; they care about capability.
Chip Real Estate and Performance/Value

- Tukwila – next generation Intel Itanium processor
  - 4 cores, 2B transistors, 30MB cache
  - 50% cache, 50% logic
  - 1% of chip area = 30M transistors = 1/3MB
  - 0.1% of chip area = 3M transistors = 1/30MB

- How much performance benefit?
- What incremental performance benefit should you expect for the last core in a 100-core? 1000-core?

Incremental performance benefit or “forward scalability”, not efficiency should be the goal.
Key Software Development Challenges

- New functionality
- Productivity
- Portability
- Performance, Performance Robustness
- Debugging/Test
- Security
- Time to market

⇒ Software Development is Hard!
⇒ Parallelism is critical for performance, but must be achieved in conjunction with all of these requirements...
HPC: What we have learned about Parallelism

- Large-scale parallelism is possible, and typically comes with scaling of problems and data
- Portable expression of parallelism matters
- High level program analysis is a critical technology
- Working with domain experts is a good idea
- Multi-version programming (algorithms and implementations) is a good idea. Autotuning is a good idea

- Locality is hard, modularity is hard, data structures are hard, efficiency is hard...

- Of course, this list is not exhaustive....
HPC... lessons not to learn ...

- Programmer effort doesn’t matter
- Hardware efficiency matters
- Low-level programming tools are acceptable
- Low-level control is an acceptable path to performance
- Horizontal locality / explicit control of communication is critical

Move beyond conventional wisdom “parallelism is hard”, based on these lessons. Parallelism can be easy.
Moving Parallel Programming Forward
Spending Moore’s Dividend (Larus)

- 30 year retrospective, analyzing Microsoft’s experience
- Spent on --
  - New Application Features
  - Higher level programming
    > Structured programming
    > Object-oriented
    > Managed runtimes
  - Programmer productivity (decreased focus)
Today, most programmers do not focus on performance

- Productivity: “Quick functionality, adequate performance”
  - Matlab, Mathematica, R, SAS, etc.
  - VisualBasic, PERL, Javascript, Python, Ruby|Rails

- Mixed: “Productivity and performance”
  - Java, C# (Managed languages + rich libraries)

- Performance: “Efficiency is critical” (HPC focus)
  - C++ and STL
  - C and Fortran

- How can we enable productivity programmers write 100-fold parallel programs?

Parallelism must be accessible to productivity programmers.
Challenge #1: Can we introduce parallelism in the Productivity Layer?

- Enable productivity programmers to create large-scale parallelism with modest effort
- A simple models of parallelism mated to productivity languages
  - Data and collection parallelism, determinism, functional/declarative
  - Parallel Libraries
- Generate scalable parallelism for many applications
- Exploit with dynamic and compiled approaches

=> May be suitable for introduction to programming classes
Challenge #2: Can we compose parallel programs safely? (and easily)

- Parallel program composition frameworks which preserved correctness of the composed parts
  - Language, execution model, a/o tools
- Interactions when necessary are controllable at the programmer’s semantic level (i.e. objects or modules)
- Composition and interactions supported efficiently by hardware

- Fulfill vision behind TM, Concurrent Collections, Concurrent Aggregates, Linda, Lock-free, Race-free, etc.
Challenge #3: Can we invent an easy, modular way to express locality?

- Describe data reuse and spatial locality
- Descriptions compose
- Enable software exploitation
- Enable hardware exploitation

- Computation = Algorithms + Data structures

- Efficient Computation = Algorithms + Data Structures + Locality
  - A + DS + L
  - (A + DS) + L
  - A + (DS + L)
  - (A + L) + DS
Challenge #4: Can we raise the level of efficient parallel programming?

• HPC model = Lowest Level of abstraction
  – Direct Control of resource mapping
  – Explicit control over communication and synchronization
  – Direct management of locality

• Starting from HPC models, how can we elevate?
Parallelism Implications for Computing Education in 2015 (and NOW!)

• Parallelism is in all computing systems, and should be front and center in education
  – An integral part of early introduction and experience with programming (simple models)
  – An integral part of early theory and algorithms (foundation)
  – An integral part of software architecture and engineering

• Observation: No biologist, physicist, chemist, or engineer thinks about the world with a fundamentally sequential foundation.

• The world is parallel! We can design large scale concurrent systems of staggering complexity.
Are All Applications Parallel?

Parallelism for the Masses
“Opportunities and Challenges”
• Deliver Tera-scale performance
  – TFLOP @ 62W, Desktop Power, 16GF/W
  – Frequency target 5GHz, 80 cores
  – Bi-section B/W of 256GB/s
  – Link bandwidth in hundreds of GB/s
• Prototype two key technologies
  – On-die interconnect fabric
  – 3D stacked memory
• Develop a scalable design methodology
  – Tiled design approach
  – Mesochronous clocking
  – Power-aware capability
OpenCirrus Testbed

- Open large-scale, global testbed for academic research
  - Catalyze creation of an Open Source Cloud stack
  - Focus on data center management and services
  - Systems-level and application-level research
  - 6 Testbeds of 1,000 to 4,000 cores each

Create an academic cloud computing research community and open source stack - www.opencirrus.org
Is Parallelism a crisis? No, there are major opportunities to lay new foundations and synergy across layers.

Expectations and Challenges: Efficiency is not king.

Moving Parallel Programming Forward
  - Productivity and Ease, Composition, Locality, and only then Efficiency
