4 Conclusions

- ProVal research group develops tools for *Deduction Verification* of Java and C source code
- Requirements: specified as *annotations* in the source
- For Java (Card): specifications given in *JML (Java Modeling Language)* $\rightsquigarrow$ *Krakatoa* tool
- For C: home-made specification language $\rightsquigarrow$ *Caduceus* tool
- Generation of *Verification Conditions*, to be discharged by *theorem provers*
- Originality: *common platform* for C and Java

JML toy example

Introduction

Context

JML: Introductory
exampleOverview of
Krakatoa

Algebraic models

Conclusions

- JML class invariants
- JML method behaviors: pre- and post-conditions

```
class Purse {  
  
    int balance;  
    //@ invariant balance >= 0;  
  
    /*@ normal_behavior  
        @    requires s >= 0;  
        @    assigns balance;  
        @    ensures balance == \old(balance)+s;  
    @*/  
    public void credit(int s) {  
        balance += s;  
    }  
}
```

Toy example (cont.)

Introduction

Context

JML: Introductory
exampleOverview of
Krakatoa

Algebraic models

Conclusions

- JML exceptional behaviors

```
/*@ behavior
   @   requires s >= 0;
   @   assigns balance;
   @   ensures s <= \old(balance) &&
   @       balance == \old(balance) - s;
   @   signals (NoCreditException)
   @       s > \old(balance) &&
   @       balance == \old(balance);
   @*/
```

```
public void withdraw(int s) throws NoCreditException {
    if (balance >= s) balance -= s;
    else throw new NoCreditException();
}
```

- *Runtime assertion checking*: JML RAC
- *Static verification*:
 - ESC/Java
 - Several others: LOOP, Jack, KeY, Jive, Bogor... Krakatoa
 - Common goal: prove advanced functional behaviors
 - Why so many tools ? hard problems, many challenges:
<http://www.cs.ru.nl/~woj/esfws06/>
- Other tools: testing, symbolic execution...

Demo: toy example (cont.)

[Introduction](#)[Overview of
Krakatoa](#)[Demo](#)[Platform overview](#)[Why intermediate
language](#)[Contributions](#)[Algebraic models](#)[Conclusions](#)

- A buggy example

```
/*@ normal_behavior
   @   requires p1.balance == 100;
   @   ensures \result == 150;
   @*/
public static int test(Purse p1, Purse p2) {
    p1.credit(50);
    p2.withdraw(100);
    return p1.balance;
}
```

Demo

- Krakatoa generates VCs for both
 - *Safety properties*: no NullPointerException, no ArrayIndexOutOfBounds, no DivisionByZero
 - Method calls: *precondition* is satisfied
 - *Methods post-conditions* are valid
 - *Class invariants* are preserved (**beware: challenging issues**)
- *Modular Approach*:
 - for each method call: only its specification is seen

Platform Architecture

[Introduction](#)[Overview of
Krakatoa](#)[Demo](#)[Platform overview](#)[Why intermediate
language](#)[Contributions](#)[Algebraic models](#)[Conclusions](#)

Platform characteristics

Introduction

Overview of
Krakatoa

Demo

Platform overview

Why intermediate
language

Contributions

Algebraic models

Conclusions

- Shared *intermediate language*: Why language
 - Only one *VCG (Verification Condition Generator)*: Why tool
 - Several provers as output:
 - allows both
 - *automatic proving* and
 - *interactive proof construction*
- for discharging VCs

Why tool

Introduction

Overview of
Krakatoa

Demo

Platform overview

Why intermediate
language

Contributions

Algebraic models

Conclusions

- Multi-prover output
- Why language :
 - programming language: a WHILE language, tailored to VC generation generation, with
 - limited side-effects: only *mutable variables*
 - *no data types*
 - basic control statements + `throw`, `try/catch`
 - program = set of functions, annotated with pre- and post-conditions
 - specification language: multi-sorted (polymorphic) *first-order logic*, with *built-in arithmetic*
- VC generation based on a *Weakest Precondition calculus*, incorporating *exceptional post-conditions*, and computation of *effects over mutable variables*.

Why as intermediate language

Introduction

Overview of
Krakatoa

Demo

Platform overview

Why intermediate
language

Contributions

Algebraic models

Conclusions

- Common approach to Java and C:
translation into Why programs
- Why specification language used both for
 - translation of input annotations
 - modeling Java objects (resp. C pointers/structures) and heap memory.
- Modeling in Why: *algebraic specifications*
 - introducing functions and predicates
 - stating axioms

Heap memory model

Principle: Burstall-Bornat 'component-as-array' model

Java	Why
$\text{balance} += s;$	$\text{balance} := \text{upd}(\text{balance}, \text{this}, \text{acc}(\text{balance}, \text{this}) + s)$

- Each *Java field* becomes a *Why mutable variable* of type '*functional array*'
- $\text{acc}(f, o)$ denotes f at index $o \rightarrow$ *encodes $o.f$*
- $\text{upd}(f, o, v)$ denotes *functional update*
- Theory of arrays:

$$\begin{aligned} \text{acc}(\text{upd}(f, o, v), o) &= v \\ o \neq o' \rightarrow \text{acc}(\text{upd}(f, o, v), o') &= \text{acc}(f, o') \end{aligned}$$

Heap memory model in Krakatoa

- Similar encoding for Java arrays
- Objects hierarchy modeled by a predicate *instanceof* with axioms.
-
- A theory for modeling *assigns* clauses [TPHOLs'05]
- Approximately 500 lines of Why specifications, + additional axioms generated on-the-fly for each Java program

Java: contributions

[Introduction](#)[Overview of
Krakatoa](#)[Demo](#)[Platform overview](#)[Why intermediate
language](#)[Contributions](#)[Algebraic models](#)[Conclusions](#)

- Krakatoa tool publicly available
- A specific modeling of Java/JML, in particular for `assigns` clauses [TPHOLs'05]
- Java Card transactions [SEFM'06]
 - on-the-fly generation of interpretation of *`beginTransaction()`*, *`commitTransaction()`*...
- Case studies:
 - PSE applet provided by Axalto [AMAST'04]
 - Demoney Applet provided by Trusted Logic

C programs: contributions

[Introduction](#)[Overview of
Krakatoa](#)[Demo](#)[Platform overview](#)[Why intermediate
language](#)[Contributions](#)[Algebraic models](#)[Conclusions](#)

- Caduceus tool publicly available
- An original modeling of heap memory and pointer arithmetic [\[ICFEM'04\]](#)
- Original support of floating-point programs [\[ARITH'07\]](#)
- Case studies:
 - Schorr-Waite graph-marking algorithm [\[SEFM'05\]](#),
 - Avionics embedded code provided by Dassault aviation company
 $\rightsquigarrow$ A original analysis of memory separation [\[submitted\]](#)

Outline

- 1 Introduction
 - Context
 - JML: Introductory example
- 2 Overview of Krakatoa
 - Demo
 - Platform overview
 - Why intermediate language
 - Contributions
- 3 Algebraic models
 - Principles
 - Example
 - Demo
- 4 Conclusions

Design choices

- Krakatoa, 2003:
 - ad-hoc interpretation of *pure* methods
- Underlying Why logic:
 - multi-sorted first order logic
 - one may declare sorts, logical functions, predicates, axioms.
- Idea:
 - use this logic for describing models of programs
 - $\rightsquigarrow$ algebraic specifications of models

Design choices

Introduction

Overview of
Krakatoa

Algebraic models

Principles

Example

Demo

Conclusions

- Caduceus, 2004:
 - allow first-order modeling at C source level
 - used for:
 - linked-list in-place reversal in C [Filliâtre & Marché, ICFEM 2004]
 - Schorr-Waite graph traversal in C [Hubert & Marché, SEFM 2005]
- Krakatoa, 2006:
 - allow first-order modeling similarly
 - but JML models are OO, not algebraic
 - so *Krakatoa now diverges from JML*: allows algebraic models (recent work, still in progress)

Example

[Introduction](#)[Overview of
Krakatoa](#)[Algebraic models](#)[Principles](#)[Example](#)[Demo](#)[Conclusions](#)

- General-purpose class for finite sets of integers
- Basic interface :

```
class IntSet {  
  
    // checks whether n belongs to this  
    public boolean mem(int n);  
  
    // adds n to this  
    public void add(int n);  
}
```

Algebraic model (1)

Introduction

Overview of
Krakatoa

Algebraic models

Principles

Example

Demo

Conclusions

- Sort, functions, predicates:

```
/*@ logic type intset;  
  @ logic intset emptyset();  
  @ logic intset singleton(int n);  
  @ logic intset union(intset s1, intset s2);  
  @ predicate in(int n,intset s);  
@*/
```

Algebraic model (2)

Introduction

Overview of
Krakatoa

Algebraic models

Principles

Example

Demo

Conclusions

- Axiomatization:

```

/*@ axiom in_empty :
  @   (\forall int n; !in(n,emptyset()));
  @
  @ axiom in_singleton :
  @   (\forall int n,k;
  @     in(n,singleton(k)) <==> n==k;
  @
  @ axiom in_union :
  @   (\forall int n; \forall intset s1,s2 ;
  @     in(n,union(s1,s2)) <==>
  @       in(n,s1) || in(n,s2);
  @
  @ axiom intset_ext :
  @   (\forall intset s1,s2 ;
  @     (\forall int n ; in(n,s1) <==> in(n,s2))
  @     ==> s1==s2) ;
  @*/

```

Specification of IntSet class

[Introduction](#)[Overview of
Krakatoa](#)[Algebraic models](#)[Principles](#)[Example](#)[Demo](#)[Conclusions](#)

Introducing a *model* field:

```
class IntSet {  
  //@ model intset my_model;
```

Methods' behaviors:

```
  //@ ensures \result <==> in(n,my_model)) ;  
  public boolean mem(int n);  
  
  /*@ assigns my_model;  
    @ model ensures  
      @ my_model == union(\old(my_model), singleton(n)) ;  
    @*/  
  public void add(int n);  
}
```

An implementation

[Introduction](#)[Overview of
Krakatoa](#)[Algebraic models](#)[Principles](#)[Example](#)[Demo](#)[Conclusions](#)

By a sorted array

```
class IntSet {  
  
    int size;  
    int t[];  
  
    /*@ invariant  
        @   t != null &&  
        @   0 <= size && size <= t.length &&  
        @   (\forall int i, j;  
        @       0 <= i && i <= j && j < size;  
        @       t[i] <= t[j]);  
    @*/  
  
}
```

Relating models and implementation

```
/*@ predicate IntSet_models(intset s, IntSet this) {  
  @   this != null &&  
  @   array_models(s,this.t,0,this.size-1)  
  @ }  
  @  
  @ predicate array_models(intset s, int t[],  
  @                           int i, int j) {  
  @   t != null &&  
  @   0 <= i && j < t.length &&  
  @   (\forall int n; in(n,s) ==>  
  @     (\exists int k;  
  @       i <= k && k <= j ; n==t[k]))  
  @ }  
  @*/  
  
/*@ invariant IntSet_models(my_model,this);
```

Demo

Refinement property

Introduction

Overview of
Krakatoa

Algebraic models

Principles

Example

Demo

Conclusions

- Proof of `add` post-condition: closure of the diagram

$$\begin{array}{llll}
 \textit{abstract level:} & \text{my_model} & \xrightarrow{\textit{add}} & \text{my_model}' \\
 & \updownarrow I & & \updownarrow I \\
 \textit{concrete level:} & \text{t,size} & \xrightarrow{\textit{add}} & \text{t',size}'
 \end{array}$$

- It is a *refinement* property.
- Comparison with the B approach in progress.

4 Conclusions

Summary

- Prototype tools, available for experimentation (open source):
<http://krakatoa.lri.fr>
<http://why.lri.fr>
- Tailored to the proof of advanced behaviors
- Originality: intermediate first-order specification language for:
 - modeling Java memory heap
 - modeling Java Card transactions
 - user-defined abstract models of programs
- *Versatility*: multi-prover output, multi-source input, allows on-the-fly generation of model

Perspectives

- GUI in the Eclipse framework
- Improved support for abstract modeling: refinement, higher-level models (UML)
- Automatic annotation generation
- Analysis of memory separation

Long term:

- Contribute to *Grand Challenge 6, Verified Software Repository*
- Key goal: *libraries* of verified software
