CMU SCS

Problem - Motivation

- Types of queries:
 - boolean ('data' AND 'retrieval' AND NOT ...)
 - additional features ('data' ADJACENT 'retrieval')
 - keyword queries ('data', 'retrieval')
- How to search a large collection of documents?

Full-text scanning

- Build a FSA; scan

CMU SCS

Full-text scanning

- for single term:
 - (naive: $O(N*M)$)

CMU SCS

Full-text scanning

- for single term:
 - (naive: $O(N*M)$)
 - Knuth Morris and Pratt ('77)
 - build a small FSA; visit every text letter once only, by carefully shifting more than one step

 - Knuth Morris and Pratt ('77)
 - Boyer and Moore ('77)
 - preprocess pattern; start from **right to left** & **skip!**

OMINOUS

Boyer+Moore: fastest, in practice
 Sunday ('90): some improvements

Full-text scanning

- For multiple terms (w/o “don’t care” characters): Aho+Corasic ('75)
 - again, build a simplified FSA in $O(M)$ time
- Probabilistic algorithms: ‘fingerprints’ (Karp + Rabin '87)
- approximate match: ‘agrep’ [Wu+Manber, Baeza-Yates+, '92]

Full-text scanning

- Approximate matching - **string editing** distance:
 - $d(\text{'survey'}, \text{'surgery'}) = 2$
 - = min # of insertions, deletions, substitutions to transform the first string into the second

- A: dynamic programming
 $cost(i, j) = cost$ to match prefix of length i of first string s with prefix of length j of second string t

Complexity: $O(M*N)$ (when using a matrix to 'memoize' partial results)

CMU SCS

Conclusions:

- Full text scanning needs no space overhead, but is slow for large datasets
