SVD - Interpretation #3

- A: SVD properties:
  - matrix product should give back matrix **A**
  - matrix **U** should be column-orthonormal, i.e., columns should be unit vectors, orthogonal to each other
  - ditto for matrix **V**
  - matrix **Λ** should be diagonal, with positive values

SVD - Complexity

- O(n * m * m) or O(n * n * m) (whichever is less)
- less work, if we just want singular values
-     or if we want first *k* singular vectors
-     or if the matrix is sparse [Berry]
- Implemented: in any linear algebra package (LINPACK, matlab, Splus, mathematica ...)

SVD - conclusions so far

- SVD: **A= U Λ V**^{T} : unique (*)
-     **U**: document-to-concept similarities
-     **V**: term-to-concept similarities
-     **Λ**: strength of each concept
- dim. reduction: keep the first few strongest singular values (80-90% of 'energy')
  - SVD: picks up linear correlations
- SVD: picks up non-zero 'blobs'
