**Why should we care?**

A: several real sequences are periodic  
Q: Such as?  
A:  
– sales patterns follow seasons;  
– economy follows 50-year cycle  
– temperature follows daily and yearly cycles  
Many real signals follow (multiple) cycles

- speaker identification
- impulses/noise -> flat spectrum
- high pitch -> high frequency

## How does it work?

Decomposes signal to a sum of sine (and cosine) waves.

Q: How to assess 'similarity' of  $\mathbf{x}$  with a wave?

$\mathbf{x} = \{x_0, x_1, \dots, x_{n-1}\}$

### How does it work?

- Basis functions are actually n-dim vectors, **orthogonal** to each other
- ‘similarity’ of **x** with each of them: inner product
- DFT: ~ all the similarities of **x** with the basis functions

### How does it work?

Since  $e^{jf} = \cos(f) + j \sin(f)$   
 ( $j = \text{sqrt}(-1)$ ),  
 we finally have:

### DFT: Parseval's theorem

$$\sum(x_i^2) = \sum(|X_f|^2)$$

Ie., DFT preserves the 'energy'  
or, alternatively: it does an axis rotation:

## Property

- Shifting  $x$  in time does NOT change the amplitude spectrum
- eg.,  $x = \{ 0 0 0 1 \}$  and  $x' = \{ 0 1 0 0 \}$ : same (flat) amplitude spectrum
- (only the phase spectrum changes)
- Useful property when we search for patterns that may 'slide'

## FFT

- However, if  $n$  is a power of 2 (or a number with many divisors), we can make it  $O(n \log n)$

Main idea: if we know the DFT of the odd time-ticks, and of the even time-ticks, we can quickly compute the whole DFT

## Advantages of Wavelets

- Better compression (better RMSE with same number of coefficients)
- closely related to the processing of the mammalian eye and ear
- Good for progressive transmission
- handle spikes well
- usually, fast to compute ( $O(n)$ !)

## Overall Conclusions

- DFT, DCT spot periodicities
- DWT : multi-resolution - matches processing of mammalian ear/eye better
- All three: powerful tools for compression, pattern detection in real signals
- All three: included in math packages (matlab, R, mathematica, ... )
