SVD - Other properties - summary

- can produce orthogonal basis (obvious) (who cares?)
- can solve over- and under-determined linear problems (see C(1) property)
- can compute 'fixed points' (= 'steady state prob. in Markov chains') (see C(4) property)

 where

\mathbf{v}_1 : $[m \times 1]$ first column (singular-vector) of \mathbf{V}

Let E be the set of edges and \mathbf{A} be the adjacency matrix:

 Let h and a be $[n \times 1]$ vectors with the 'hubness' and 'authoritativeness' scores.
 Then:

Then:

$$h_i = a_n + a_p + a_q$$

that is

or

$$\mathbf{h} = \mathbf{A} \mathbf{a}$$

In conclusion, we want vectors \mathbf{h} and \mathbf{a} such that:

$$\mathbf{h} = \mathbf{A} \mathbf{a} \quad \|\cdot\|$$

$$\mathbf{a} = \mathbf{A}^T \mathbf{h} \quad \|\cdot\|$$

Recall properties:

C(2): $\mathbf{A}_{[n \times m]} \mathbf{v}_1_{[m \times 1]} = \lambda_1 \mathbf{u}_1_{[n \times 1]}$
 C(3): $\mathbf{u}_1^T \mathbf{A} = \lambda_1 \mathbf{v}_1^T$

In short, the solutions to

$$\mathbf{h} = \mathbf{A} \mathbf{a}$$

$$\mathbf{a} = \mathbf{A}^T \mathbf{h}$$

are the left- and right- singular-vectors of the adjacency matrix \mathbf{A} .

Starting from random \mathbf{a}' and iterating, we'll eventually converge
