 CMU SCS

Introduction

- After ER design, schema refinement, and the definition of views, we have the *conceptual* and *external* schemas for our database.
- Next step?

Faloutsos

CMU SCS 15-415

3

---

---

---

---

---

---

---

 CMU SCS

## Introduction

- After ER design, schema refinement, and the definition of views, we have the *conceptual* and *external* schemas for our database.
- Next step?
- choose indexes, make clustering decisions, and to refine the conceptual and external schemas (if necessary) to meet performance goals.
- How to decide the above?

FaloutsosCMU SCS 15-4154

---

---

---

---

---

---

---

 CMU SCS

## Introduction

- We must begin by understanding the **workload**:
  - The most important queries and how often they arise.
  - The most important updates and how often they arise.
  - The desired performance for these queries and updates.

FaloutsosCMU SCS 15-4155

---

---

---

---

---

---

---

 CMU SCS

## Decisions to Make

- ??

FaloutsosCMU SCS 15-4156

---

---

---

---

---

---

---

 CMU SCS

Decisions to Make

- What indexes should we create?
- For each index, what kind of an index should it be?
- Should we make changes to the conceptual schema?

FaloutsosCMU SCS 15-4157

---

---

---

---

---

---

---

 CMU SCS

Decisions to Make

- What indexes should we create?
  - Which relations should have indexes? What field(s) should be the search key? Should we build several indexes?
- For each index, what kind of an index should it be?
  - Clustered? Hash/tree?
- Should we make changes to the conceptual schema?
  - Consider alternative normalized schemas? (Remember, there are many choices in decomposing into BCNF, etc.)
  - Should we “undo” some decomposition steps and settle for a lower normal form? (*Denormalization.*)
  - Horizontal partitioning, replication, views ...

FaloutsosCMU SCS 15-4158

---

---

---

---

---

---

---

 CMU SCS

Overview

- Introduction
- ➡• Index selection and clustering
- Database tuning (de-normalization etc)
- Impact of concurrency

FaloutsosCMU SCS 15-4159

---

---

---

---

---

---

---

CMU SCS

Example 1

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE D.dname='Toy' AND E.dno=D.dno
```

- which index, if any, would you build?

Faloutsos

CMU SCS 15-415

10

---

---

---

---

---

---

---

CMU SCS

Example 1

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE D.dname='Toy' AND E.dno=D.dno
```

- Hash index on *D.dname* supports ‘Toy’ selection.
  - Given this, index on *D.dno* is not needed.
- Hash index on *E.dno* allows us to get matching (inner) Emp tuples for each selected (outer) Dept tuple.

Faloutsos

CMU SCS 15-415

11

---

---

---

---

---

---

---

CMU SCS

Example 1

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE D.dname='Toy' AND E.dno=D.dno
```

- What if WHERE included: `` ... AND E.age=25`` ?

Faloutsos

CMU SCS 15-415

12

---

---

---

---

---

---

---

CMU SCS

### Example 1

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE D.dname='Toy' AND E.dno=D.dno
```

- What if WHERE included: ``... AND E.age=25'' ?
  - Could retrieve Emp tuples using index on *E.age*, then join with Dept tuples satisfying *dname* selection. Comparable to strategy that used *E.dno* index.
  - So, if *E.age* index is already created, this query provides much less motivation for adding an *E.dno* index.

Faloutsos CMU SCS 15-415 13

---

---

---

---

---

---

---

---

CMU SCS

### Example 2

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE E.sal BETWEEN 10000 AND 20000
AND E.hobby='Stamps' AND E.dno=D.dno
```

Faloutsos CMU SCS 15-415 14

---

---

---

---

---

---

---

---

CMU SCS

### Example 2

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE E.sal BETWEEN 10000 AND 20000
AND E.hobby='Stamps' AND E.dno=D.dno
```

- Clearly, Emp should be the outer relation.
  - Suggests that we build a hash index on *D.dno*.
- What index should we build on Emp?
  - B+ tree on *E.sal* could be used, OR an index on *E.hobby* could be used. Only one of these is needed, and which is better depends upon the selectivity of the conditions.
    - As a rule of thumb, equality selections more selective than range selections.
- As both examples indicate, our choice of indexes is guided by the plan(s) that we expect an optimizer to consider for a query. *Have to understand optimizers!*

Faloutsos CMU SCS 15-415 15

---

---

---

---

---

---

---

---

 CMU SCS

## Clustering and Joins

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE D.dname='Toy' AND E.dno=D.dno
```

- What plan? what clustering?

FaloutsosCMU SCS 15-41516

---

---

---

---

---

---

---

 CMU SCS

## Clustering and Joins

```
SELECT E.ename, D.mgr
FROM Emp E, Dept D
WHERE D.dname='Toy' AND E.dno=D.dno
```

- Clustering is especially important when accessing inner tuples in INL.
  - Should make index on *E.dno* clustered.

FaloutsosCMU SCS 15-41517

---

---

---

---

---

---

---

 CMU SCS

## Overview

- Introduction
- Index selection and clustering
- ➡ • Database tuning (de-normalization etc)
- Impact of concurrency

FaloutsosCMU SCS 15-41520

---

---

---

---

---

---

---

 CMU SCS

### Tuning the Conceptual Schema

- The choice of conceptual schema should be guided by the workload, in addition to redundancy issues:
  - We may settle for a 3NF schema rather than BCNF.
  - Workload may influence the choice we make in decomposing a relation into 3NF or BCNF.
  - We may further decompose a BCNF schema!
  - We might *denormalize* (i.e., undo a decomposition step), or we might add fields to a relation.
  - We might consider *horizontal decompositions*.

FaloutsosCMU SCS 15-41521

---

---

---

---

---

---

---

 CMU SCS

### Tuning the Conceptual Schema

- If such changes are made after a database is in use: called *schema evolution*
- Q: How to mask these changes from applications?

FaloutsosCMU SCS 15-41522

---

---

---

---

---

---

---

 CMU SCS

### Tuning the Conceptual Schema

- If such changes are made after a database is in use: called *schema evolution*
- Q: How to mask these changes from applications?
- A: Views!

FaloutsosCMU SCS 15-41523

---

---

---

---

---

---

---

CMU SCS

## Tuning the Conceptual Schema

- The choice of conceptual schema should be guided by the workload, in addition to redundancy issues:
  - ▶ We may settle for a 3NF schema rather than BCNF.
    - Workload may influence the choice we make in decomposing a relation into 3NF or BCNF.
    - We may further decompose a BCNF schema!
    - We might *denormalize* (i.e., undo a decomposition step), or we might add fields to a relation.
    - We might consider *horizontal decompositions*.

Faloutsos CMU SCS 15-415 24

---

---

---

---

---

---

---

---

CMU SCS

## Example?

- Q: When would we choose 3NF instead of BCNF?

Faloutsos CMU SCS 15-415 25

---

---

---

---

---

---

---

---

CMU SCS

## Example?

- Q: When would we choose 3NF instead of BCNF?
- A: Student-Teacher-subJect (STJ)
  - $SJ \rightarrow T$
  - $T \rightarrow J$
  - and queries ask for all three attributes ( `select *` )

Faloutsos CMU SCS 15-415 26

---

---

---

---

---

---

---

---

CMU SCS

## Tuning the Conceptual Schema

- The choice of conceptual schema should be guided by the workload, in addition to redundancy issues:
  - We may settle for a 3NF schema rather than BCNF.
  - Workload may influence the choice we make in decomposing a relation into 3NF or BCNF.
- ▶ We may further decompose a BCNF schema!
  - We might *denormalize* (i.e., undo a decomposition step), or we might add fields to a relation.
  - We might consider *horizontal decompositions*.

Faloutsos CMU SCS 15-415 27

---

---

---

---

---

---

---

CMU SCS

## Decomposition of a BCNF Relation

- Q: Scenario?

Faloutsos CMU SCS 15-415 28

---

---

---

---

---

---

---

CMU SCS

## Decomposition of a BCNF Relation

- Q: Scenario?
- A: eg., STUDENT(ssn, name, address, ph#, ...)
- with many queries like

```
select ssn, name
from student
```

Faloutsos CMU SCS 15-415 29

---

---

---

---

---

---

---

CMU SCS

### Tuning the Conceptual Schema

- The choice of conceptual schema should be guided by the workload, in addition to redundancy issues:
  - We may settle for a 3NF schema rather than BCNF.
  - Workload may influence the choice we make in decomposing a relation into 3NF or BCNF.
  - We may further decompose a BCNF schema!
- ➡ We might *denormalize* (i.e., undo a decomposition step), or we might add fields to a relation.
- We might consider *horizontal decompositions*.

Faloutsos

CMU SCS 15-415

30

---

---

---

---

---

---

---

CMU SCS

### De-normalization

- Q: Scenario?

Faloutsos

CMU SCS 15-415

31

---

---

---

---

---

---

---

CMU SCS

### De-normalization

- Q: Scenario?
- A: E.g.,
  - STUDENT (ssn, name)
  - TAKES (ssn, cid, grade)
  - COURSE (cid, cname)
- and many queries like: ‘class roster for db-apps’

Faloutsos

CMU SCS 15-415

32

---

---

---

---

---

---

---

## Tuning the Conceptual Schema

- The choice of conceptual schema should be guided by the workload, in addition to redundancy issues:
  - We may settle for a 3NF schema rather than BCNF.
  - Workload may influence the choice we make in decomposing a relation into 3NF or BCNF.
  - We may further decompose a BCNF schema!
  - We might *denormalize* (i.e., undo a decomposition step), or we might add fields to a relation.
- ➡ We might consider *horizontal decompositions*.

Faloutsos CMU SCS 15-415 33

---

---

---

---

---

---

---

---

## Horizontal Decompositions

Sometimes, might want to replace relation by a collection of relations that are *selections*. Eg.,

STUDENT (ssn, name, status)

decomposed to

CurrentStudent (ssn, name, status)

Alumni (ssn, name, status)

Q: under what scenario would this help performance?

Faloutsos CMU SCS 15-415 34

---

---

---

---

---

---

---

---

## Masking Conceptual Schema Changes

```
CREATE VIEW STUDENT(ssn, name, status)
AS SELECT *
FROM CurrentStudent
UNION
SELECT *
FROM Alumni
```

- Masks change
- But performance-minded users should query the right table

Faloutsos CMU SCS 15-415 35

---

---

---

---

---

---

---

---

 CMU SCS

### Tuning Queries and Views

- If a query runs slower than expected, what to check?

FaloutsosCMU SCS 15-41536

---

---

---

---

---

---

---

 CMU SCS

### Tuning Queries and Views

- If a query runs slower than expected, check
  - whether an index needs to be re-built, or
  - whether statistics are too old or
  - the plan that is used! (and adjust indices/query/views)

FaloutsosCMU SCS 15-41537

---

---

---

---

---

---

---

 CMU SCS

### Tuning Queries and Views

- Sometimes, the DBMS may not be executing the plan you had in mind. Common areas of weakness:

FaloutsosCMU SCS 15-41538

---

---

---

---

---

---

---

 CMU SCS

### Tuning Queries and Views

- Sometimes, the DBMS may not be executing the plan you had in mind. Common areas of weakness:
  - Selections involving **null values**.
  - Selections involving **arithmetic or string expressions**.
  - Selections involving **OR** conditions.
  - **Lack of evaluation features** like index-only strategies or certain join methods or poor size estimation.

FaloutsosCMU SCS 15-41539

---

---

---

---

---

---

---

 CMU SCS

### Rewriting SQL Queries

- Complicated by interaction of:
  - **NULLs**, duplicates, aggregation, subqueries.
- **Guideline:** Use **only one “query block”**, if possible.

```
SELECT DISTINCT *  
FROM Sailors S  
WHERE S.sname IN  
      (SELECT Y.sname  
       FROM YoungSailors Y)
```

=

??

FaloutsosCMU SCS 15-41540

---

---

---

---

---

---

---

 CMU SCS

### Rewriting SQL Queries

- Complicated by interaction of:
  - **NULLs**, duplicates, aggregation, subqueries
- Guideline: Use **only one “query block”**, if possible.

```
SELECT DISTINCT *  
FROM Sailors S  
WHERE S.sname IN  
      (SELECT Y.sname  
       FROM YoungSailors Y)
```

=

```
SELECT DISTINCT S.*  
FROM Sailors S,  
      YoungSailors Y  
WHERE S.sname = Y.sname
```

FaloutsosCMU SCS 15-41541

---

---

---

---

---

---

---

 CMU SCS

### More Guidelines for Query Tuning

- Minimize the use of DISTINCT: don't need it if duplicates are acceptable, or if answer contains a key.

FaloutsosCMU SCS 15-41542

---

---

---

---

---

---

---

 CMU SCS

### More Guidelines for Query Tuning

- Consider DBMS use of index when writing arithmetic expressions:
- $E.age = 2 * D.age$  will benefit from index on  $E.age$ , but might not benefit from index on  $D.age$ !

FaloutsosCMU SCS 15-41543

---

---

---

---

---

---

---

 CMU SCS

### More Guidelines for Query Tuning

- Minimize the use of GROUP BY and HAVING:

```
SELECT MIN (E.age)
FROM Employee E
GROUP BY E.dno
HAVING E.dno=102
```

→ ??

FaloutsosCMU SCS 15-41544

---

---

---

---

---

---

---

CMU SCS

### More Guidelines for Query Tuning

- Minimize the use of GROUP BY and HAVING:

```
SELECT MIN (E.age)
FROM Employee E
GROUP BY E.dno
HAVING E.dno=102
```

→

```
SELECT MIN (E.age)
FROM Employee E
WHERE E.dno=102
```

Faloutsos

CMU SCS 15-415

45

---

---

---

---

---

---

---

CMU SCS

### Guidelines for Query Tuning (Contd.)

- Avoid using intermediate relations:

vs. ???

```
SELECT * INTO Temp
FROM Emp E, Dept D
WHERE E.dno=D.dno
      AND D.mgrname='Joe'
```

and

```
SELECT T.dno, AVG(T.sal)
FROM Temp T
GROUP BY T.dno
```

Faloutsos

CMU SCS 15-415

46

---

---

---

---

---

---

---

CMU SCS

### Guidelines for Query Tuning (Contd.)

- Avoid using intermediate relations:

vs.

```
SELECT E.dno, AVG(E.sal)
FROM Emp E, Dept D
WHERE E.dno=D.dno
      AND D.mgrname='Joe'
GROUP BY E.dno
```

and

```
SELECT * INTO Temp
FROM Emp E, Dept D
WHERE E.dno=D.dno
      AND D.mgrname='Joe'
```

and

```
SELECT T.dno, AVG(T.sal)
FROM Temp T
GROUP BY T.dno
```

Faloutsos

CMU SCS 15-415

47

---

---

---

---

---

---

---

CMU SCS

### Guidelines for Query Tuning (Contd.)

- Avoid using intermediate relations:

vs.

```
SELECT E.dno, AVG(E.sal)
FROM Emp E, Dept D
WHERE E.dno=D.dno
      AND D.mgrname='Joe'
GROUP BY E.dno
```

```
SELECT * INTO Temp
FROM Emp E, Dept D
WHERE E.dno=D.dno
      AND D.mgrname='Joe'

      and

SELECT T.dno, AVG(T.sal)
FROM Temp T
GROUP BY T.dno
```
- Does not materialize the intermediate reln Temp.
- If there is a dense B+ tree index on *<dno, sal>*, an index-only plan can be used to avoid retrieving Emp tuples in the second query!

Faloutsos

CMU SCS 15-415

48

---

---

---

---

---

---

---

---

CMU SCS

### Overview

- Introduction
- Index selection and clustering
- Database tuning (de-normalization etc)
- ➡ Impact of concurrency

CMU SCS 15-415

49

---

---

---

---

---

---

---

---

CMU SCS

### Concurrency

- Reduce lock durations
- Reduce hot spots

Faloutsos

CMU SCS 15-415

50

---

---

---

---

---

---

---

---

 CMU SCS

Concurrency

- Reduce lock durations

FaloutsosCMU SCS 15-41551

---

---

---

---

---

---

---

 CMU SCS

Concurrency

- Reduce lock durations
  - make transactions faster
  - break long transactions in shorter ones (but...)
  - build a warehouse
  - consider lower isolation level

FaloutsosCMU SCS 15-41552

---

---

---

---

---

---

---

 CMU SCS

Concurrency

- Reduce hot spots

FaloutsosCMU SCS 15-41553

---

---

---

---

---

---

---

CMU SCS

## Concurrency

- Reduce hot spots
  - delay operations on hot spots
  - optimize access patterns
  - partition (batch) operations on hot spots
  - choice of index (root of B-tree -> hot spot)

Faloutsos CMU SCS 15-415 54

---

---

---

---

---

---

---

---

CMU SCS

## Summary

- Database design consists of several tasks:  
*requirements analysis, conceptual design, schema refinement, physical design and tuning.*
  - In general, have to go back and forth between these tasks to refine a database design, and decisions in one task can influence the choices in another task.

Also see the paper by Roussopoulos + Yeh  
 (on the course web site)

Faloutsos CMU SCS 15-415 55

---

---

---

---

---

---

---

---

CMU SCS

## Summary (cont'd)

- Understanding the nature of the *workload* is vital:
  - What are the important queries and updates? What attributes/relations are involved?
- then:
  - refine conceptual schema and views
  - tune queries (indices, clustering, re-writing)

Faloutsos CMU SCS 15-415 56

---

---

---

---

---

---

---

---

CMU SCS

### Summary - schema refinement

- May choose 3NF or lower normal form over BCNF.
- May *denormalize*, or undo some decompositions.
- May decompose a BCNF relation further!
- May choose a *horizontal decomposition* of a relation.
- Importance of dependency-preservation based upon the dependency to be preserved, and the cost of the IC check (see text)

Faloutsos CMU SCS 15-415 57

---

---

---

---

---

---

---

---

CMU SCS

### Summary - Tuning

Tuning: on slow queries, check the chosen plan!

- Over time, indexes have to be fine-tuned (dropped, created, re-built, ...) for performance.
- System may still not find a good plan:
  - Only left-deep plans considered!
  - Null values, arithmetic conditions, string expressions, the use of ORs, etc. can confuse an optimizer.

Faloutsos CMU SCS 15-415 58

---

---

---

---

---

---

---

---

CMU SCS

### Summary - Tuning

So, may have to rewrite the query/view: Avoid

- nested queries,
- temporary relations,
- complex conditions, and
- operations like DISTINCT and GROUP BY.

Faloutsos CMU SCS 15-415 59

---

---

---

---
