

- Memory-based learning
- Lazy learning

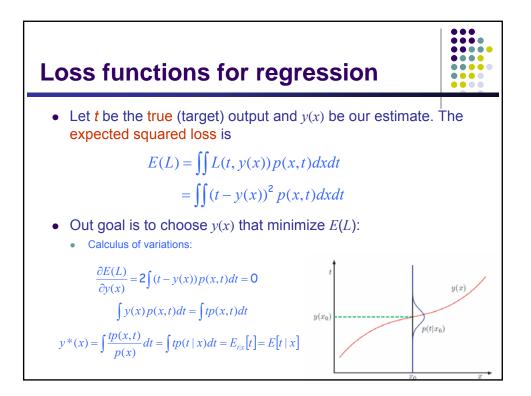

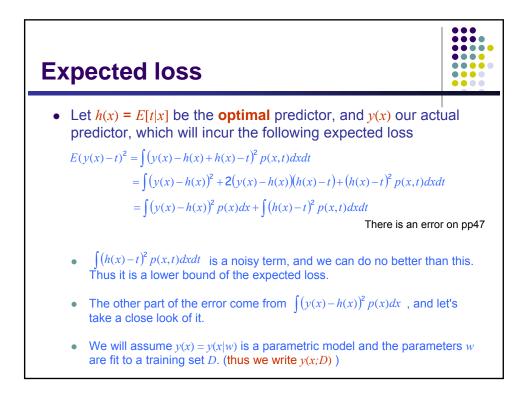

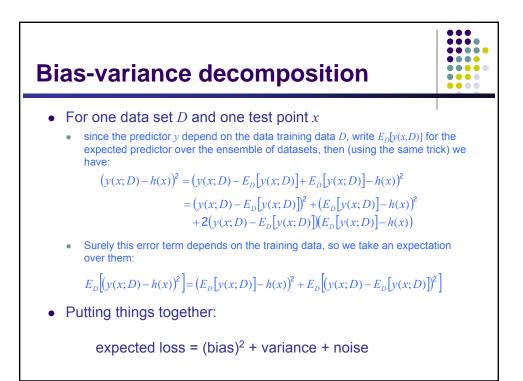

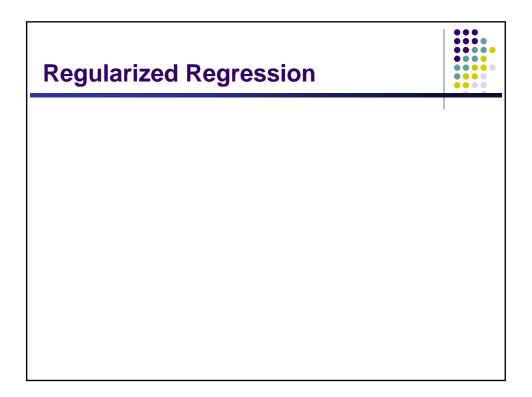

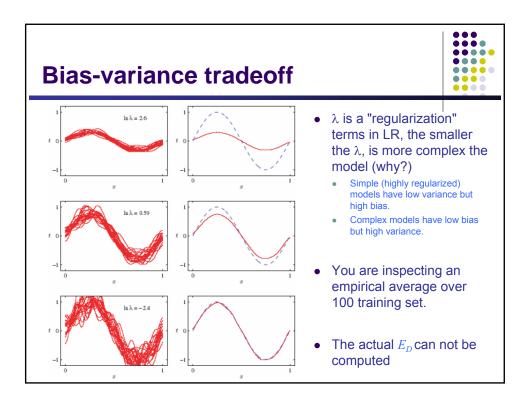

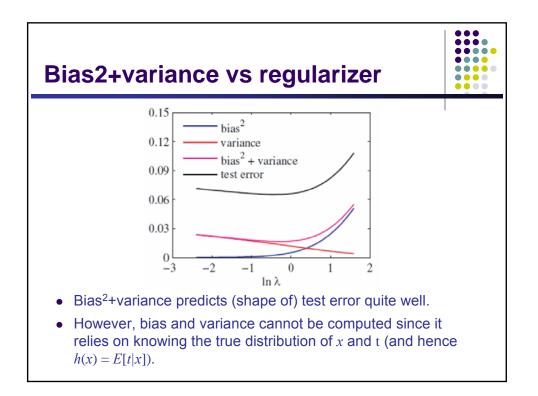

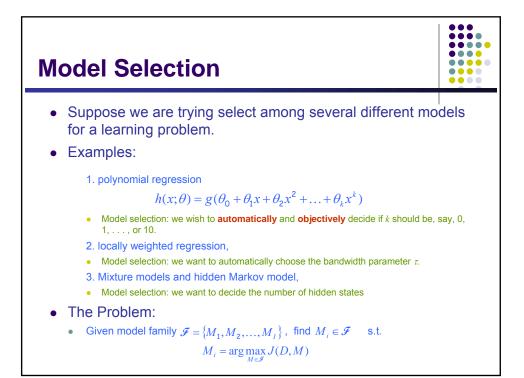

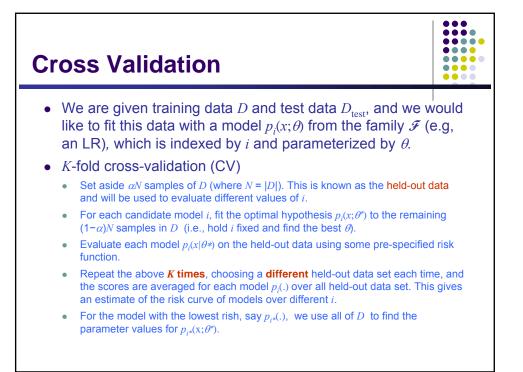

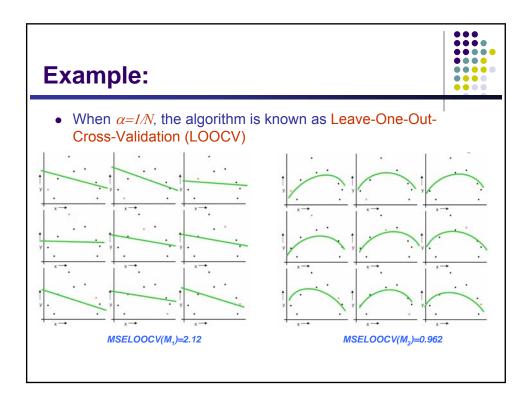

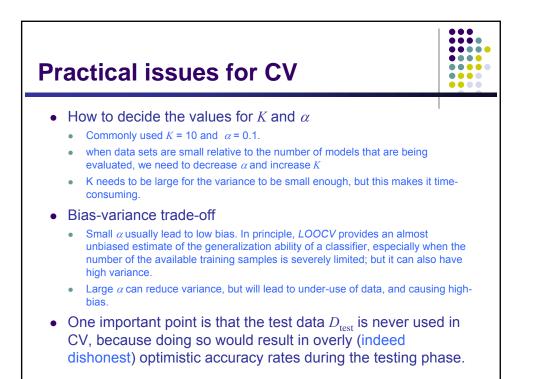

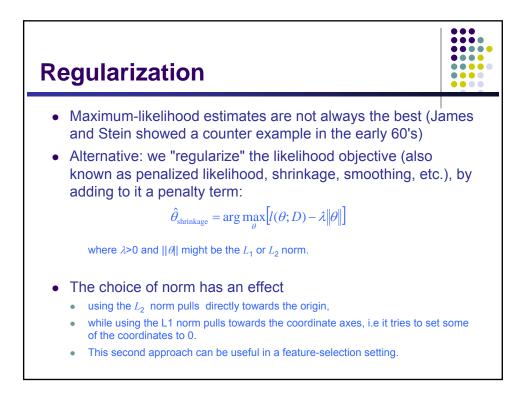

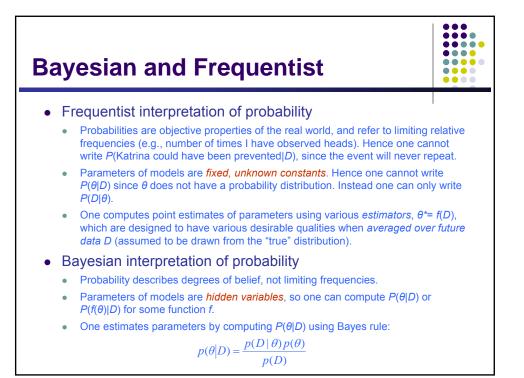

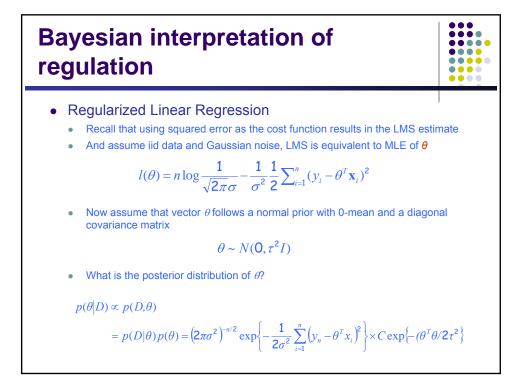

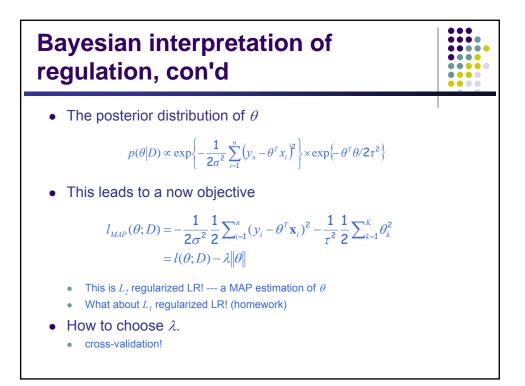

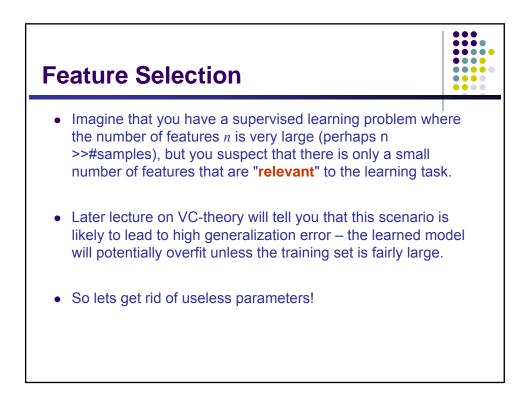

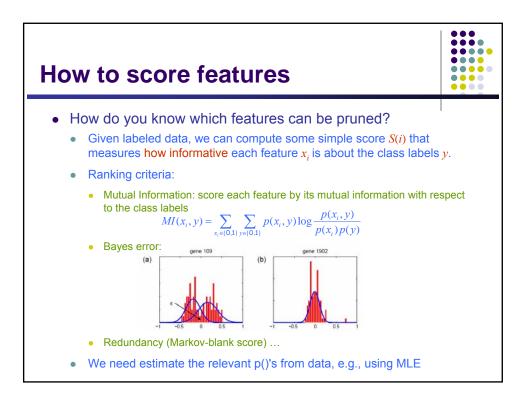

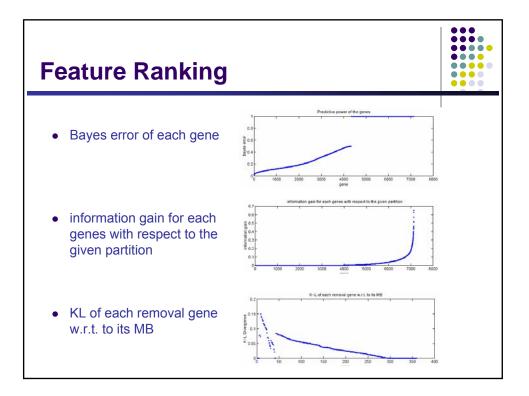

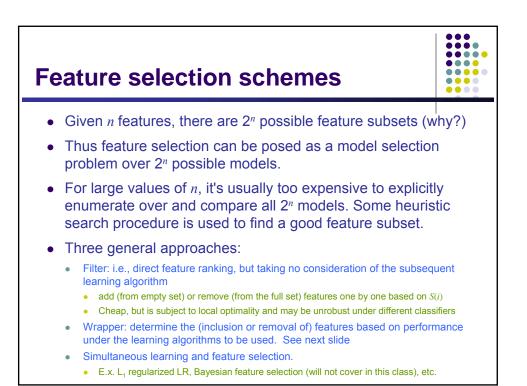

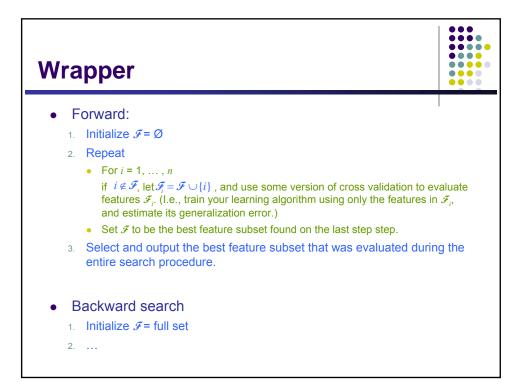

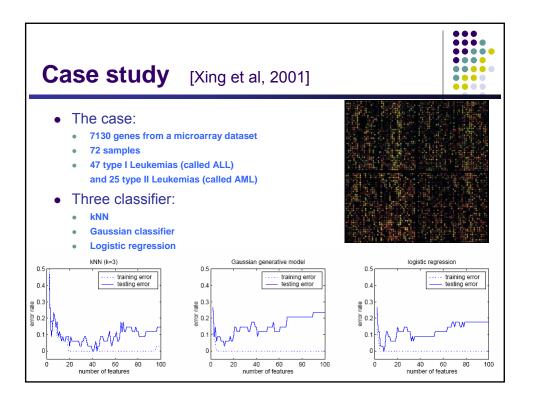

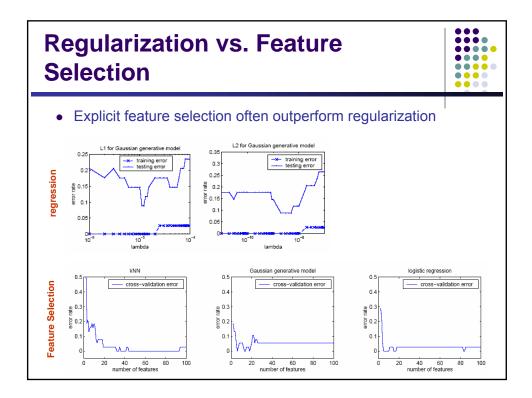

- How can we compare the closeness of a learned hypothesis and the true model?
- The relative entropy (also known as the <u>Kullback-Leibler</u> <u>divergence</u>) is a measure of how different two probability distributions (over the same event space) are.
  - For 2 pdfs, *p*(*x*) and *q*(*x*), their *KL-devergence* is:

$$D(p \| q) = \sum_{x \in \mathbf{X}} p(x) \log \frac{p(x)}{q(x)} \mathcal{I}$$

• The KL divergence between *p* and *q* can also be seen as the average number of bits that are wasted by encoding events from a distribution *p* with a code based on a not-quite-right distribution *q*.
