

Probabilistic Graphical Models

Max-margin learning of GM

Eric Xing

Lecture 28, Apr 28, 2014

Reading:

Classical Predictive Models

- Input and output space: $\mathcal{X} \triangleq \mathbb{R}^{M_x}$ $\mathcal{Y} \triangleq \{-1, +1\}$
- Predictive function $h(\mathbf{x})$: $y^* = h(\mathbf{x}) \triangleq \arg \max_{y \in \mathcal{Y}} F(\mathbf{x}, y; \mathbf{w})$
- Examples: $F(\mathbf{x}, y; \mathbf{w}) = g(\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y))$
- Learning: $\hat{\mathbf{w}} = \arg\min_{\mathbf{w} \in \mathcal{W}} \ell(\mathbf{x}, y; \mathbf{w}) + \lambda R(\mathbf{w})$

where $\ell(\cdot)$ represents a convex loss, and $R(\mathbf{w})$ is a regularizer preventing overfitting

- Logistic Regression
 - Max-likelihood (or MAP) estimation

$$\max_{\mathbf{w}} \mathcal{L}(\mathcal{D}; \mathbf{w}) \triangleq \sum_{i=1}^{N} \log p(y^{i} | \mathbf{x}^{i}; \mathbf{w}) + \mathcal{N}(\mathbf{w})$$

$$\ell_{LL}(\mathbf{x}, y; \mathbf{w}) \triangleq \ln \sum_{y' \in \mathcal{Y}} \exp{\{\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y')\}} - \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y)$$

- Support Vector Machines (SVM)
 - Max-margin learning

$$\min_{\mathbf{w},\xi} \ \frac{1}{2} \mathbf{w}^{\mathsf{T}} \mathbf{w} + C \sum_{i=1}^{N} \xi_i;$$

s.t.
$$\forall i, \forall y' \neq y^i : \mathbf{w}^\top \Delta \mathbf{f}_i(y') \ge 1 - \xi_i, \ \xi_i \ge 0.$$

$$\ell_{MM}(\mathbf{x}, y; \mathbf{w}) \triangleq \max_{y' \in \mathcal{Y}} \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y') - \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y) + \ell'(y', y)$$

Classical Predictive Models

• Input and output space: $\mathcal{X} \triangleq \mathbb{R}^{M_x}$

$$\mathcal{Y} \triangleq \{-1, +1\}$$

Learning:

$$\hat{\mathbf{w}} = \arg\min_{\mathbf{w} \in \mathcal{W}} \ell(\mathbf{x}, y; \mathbf{w}) + \lambda R(\mathbf{w})$$

where $\ell(\cdot)$ represents a convex loss, and $R(\mathbf{w})$ is a regularizer preventing overfitting

- Logistic Regression
 - Max-likelihood (or MAP) estimation

$$\max_{\mathbf{w}} \mathcal{L}(\mathcal{D}; \mathbf{w}) \triangleq \sum_{i=1}^{N} \log p(y^{i} | \mathbf{x}^{i}; \mathbf{w}) + \mathcal{N}(\mathbf{w})$$

• Corresponds to a Log loss with L2 R

$$\ell_{LL}(\mathbf{x}, y; \mathbf{w}) \triangleq \ln \sum_{y' \in \mathcal{Y}} \exp{\{\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y')\}} - \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y)$$

- Support Vector Machines (SVM)
 - Max-margin learning

$$\min_{\mathbf{w}, \xi} \ \frac{1}{2} \mathbf{w}^{\top} \mathbf{w} + C \sum_{i=1}^{N} \xi_i;$$

s.t.
$$\forall i, \forall y' \neq y^i : \mathbf{w}^{\top} \Delta \mathbf{f}_i(y') \ge 1 - \xi_i, \ \xi_i \ge 0.$$

Corresponds to a hinge loss with L2 R

$$\ell_{MM}(\mathbf{x}, y; \mathbf{w}) \triangleq \max_{y' \in \mathcal{Y}} \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y') - \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y) + \ell'(y', y)$$

Advantages:

- 1. Full probabilistic semantics
- 2. Straightforward Bayesian or direct regularization
- 3. Hidden structures or generative hierarchy

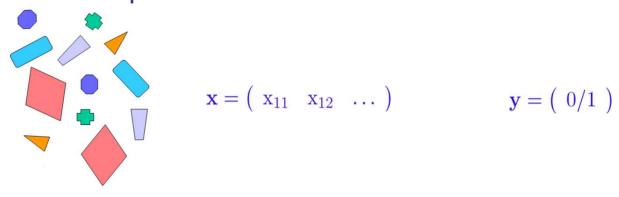

Advantages:

- 1. Dual sparsity: few support vectors
- 2. Kernel tricks
- 3. Strong empirical results

Structured Prediction Problem

Unstructured prediction

$$\mathbf{x} = (x_{11} \quad x_{12} \quad \dots)$$

$$\mathbf{y} = (0/1)$$

- Structured prediction
 - Part of speech tagging

 ${
m x}=$ "Do you want sugar in it?" $\;\Rightarrow\;\; {
m y}=$ <verb pron verb noun prep pron>

Image segmentation

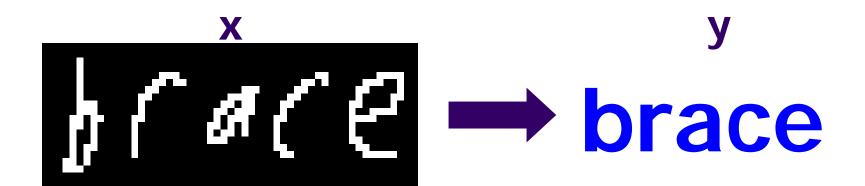

$$\mathbf{x} = \begin{pmatrix} \mathbf{x}_{11} & \mathbf{x}_{12} & \dots \\ \mathbf{x}_{21} & \mathbf{x}_{22} & \dots \\ \vdots & \vdots & \dots \end{pmatrix} \qquad \mathbf{y} = \begin{pmatrix} y_{11} & y_{12} & \dots \\ y_{21} & y_{22} & \dots \\ \vdots & \vdots & \dots \end{pmatrix}$$

$$\mathbf{y} = \begin{pmatrix} y_{11} & y_{12} & \dots \\ y_{21} & y_{22} & \dots \\ \vdots & \vdots & \dots \end{pmatrix}$$

OCR example

Sequential structure

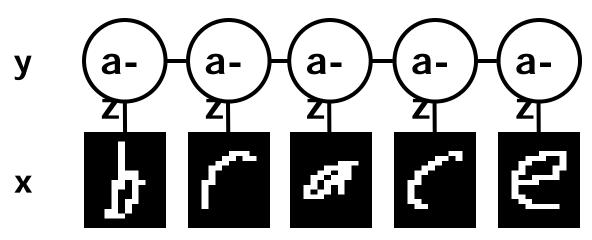

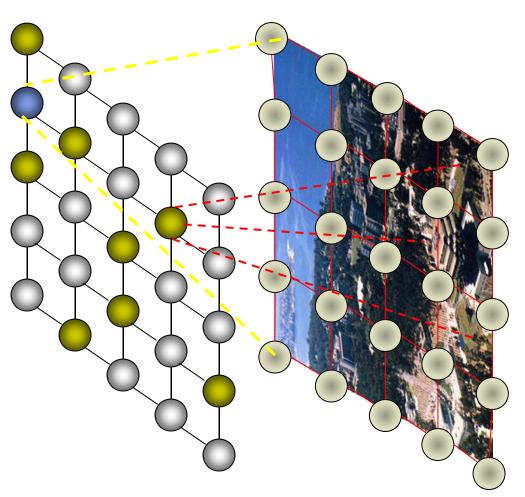

Image Segmentation

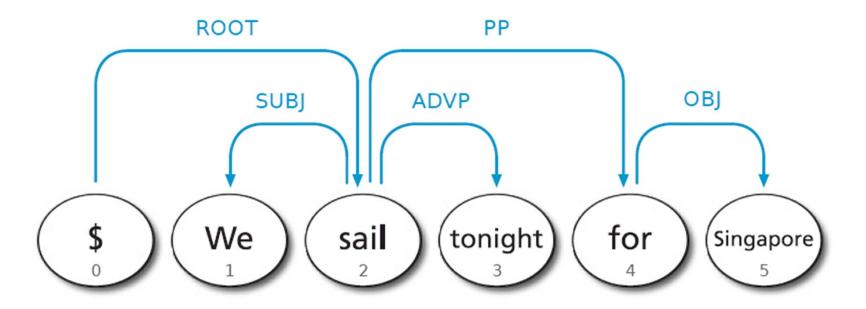

$$p_{\theta}(y \mid x) = \frac{1}{Z(\theta, x)} \exp \left\{ \sum_{c} \theta_{c} f_{c}(x, y_{c}) \right\}$$

- Jointly segmenting/annotating images
- Image-image matching, imagetext matching
- Problem:
 - Given structure (feature), learning $\vec{\theta}$
 - Learning sparse, interpretable,
 predictive structures/features

Dependency parsing of Sentences

Challenge:

Structured outputs, and globally constrained to be a valid tree

Structured Prediction Graphical Models

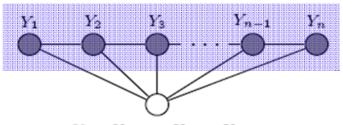

- Input and output space $\mathcal{X} \triangleq \mathbb{R}_{X_1} imes, \ldots, \mathbb{R}_{X_K}$ $\mathcal{Y} \triangleq \mathbb{R}_{Y_1} imes, \ldots, \mathbb{R}_{Y_{K'}}$
- Conditional Random Fields (CRFs) (Lafferty et al 2001)
 - Based on a Logistic Loss (LR)
 - Max-likelihood estimation (pointestimate)

$$\mathcal{L}(\mathcal{D}; \mathbf{w}) \triangleq \log \sum_{\mathbf{y}'} \exp(\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}')) \\ -\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y})$$

- Max-margin Markov Networks (M³Ns) (Taskar et al 2003)
 - Based on a Hinge Loss (SVM)
 - Max-margin learning (point-estimate)

$$\mathcal{L}(\mathcal{D}; \mathbf{w}) \triangleq \log \max_{\mathbf{y}'} \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}')$$
$$-\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}) + \ell(\mathbf{y}', \mathbf{y})$$

• Markov properties are encoded in the feature functions f(x, y)

$$X = X_1, \dots, X_{n-1}, X_n$$

Structured Prediction Graphical Models

- Conditional Random Fields (CRFs) (Lafferty et al 2001)
 - Based on a Logistic Loss (LR)
 - Max-likelihood estimation (pointestimate)

$$\mathcal{L}(\mathcal{D}; \mathbf{w}) \triangleq \log \sum_{\mathbf{y}'} \exp(\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}'))$$
$$-\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}) + R(\mathbf{w})$$

- Max-margin Markov Networks (M³Ns) (Taskar et al 2003)
 - Based on a Hinge Loss (SVM)
 - Max-margin learning (point-estimate)

$$\mathcal{L}(\mathcal{D}; \mathbf{w}) \triangleq \log \max_{\mathbf{y}'} \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}')$$
$$-\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}) + \ell(\mathbf{y}', \mathbf{y})$$
$$+R(\mathbf{w})$$

Challenges:

- SPARSE "Interpretable" prediction model
- Prior information of structures
- Latent structures/variables
- Time series and non-stationarity
- Scalable to large-scale problems (e.g., 10⁴ input/output dimension)

Comparing to unstructured predictive models

• Input and output space: $\mathcal{X} \triangleq \mathbb{R}^{M_x}$

$$\mathcal{Y} \triangleq \{-1, +1\}$$

Learning:

$$\hat{\mathbf{w}} = \arg\min_{\mathbf{w} \in \mathcal{W}} \ell(\mathbf{x}, y; \mathbf{w}) + \lambda R(\mathbf{w})$$

where $\ell(\cdot)$ represents a convex loss, and $R(\mathbf{w})$ is a regularizer preventing overfitting

- Logistic Regression
 - Max-likelihood (or MAP) estimation

$$\max_{\mathbf{w}} \mathcal{L}(\mathcal{D}; \mathbf{w}) \triangleq \sum_{i=1}^{N} \log p(y^{i} | \mathbf{x}^{i}; \mathbf{w}) + \mathcal{N}(\mathbf{w})$$

• Corresponds to a Log loss with L2 R

$$\ell_{LL}(\mathbf{x}, y; \mathbf{w}) \triangleq \ln \sum_{y' \in \mathcal{Y}} \exp{\{\mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y')\}} - \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y)$$

- Support Vector Machines (SVM)
 - Max-margin learning

$$\min_{\mathbf{w}, \xi} \ \frac{1}{2} \mathbf{w}^{\top} \mathbf{w} + C \sum_{i=1}^{N} \xi_i;$$

s.t.
$$\forall i, \forall y' \neq y^i : \mathbf{w}^{\top} \Delta \mathbf{f}_i(y') \ge 1 - \xi_i, \ \xi_i \ge 0.$$

Corresponds to a hinge loss with L2 R

$$\ell_{MM}(\mathbf{x}, y; \mathbf{w}) \triangleq \max_{y' \in \mathcal{Y}} \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y') - \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, y) + \ell'(y', y)$$

$$h(\mathbf{x}) = \arg\max_{\mathbf{y} \in \mathcal{Y}(\mathbf{x})} s_{\mathbf{x}}(\mathbf{x}, \mathbf{y})$$
 space of feasible outputs

Assumptions:

$$score(\mathbf{x}, \mathbf{y}) = \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}) = \sum_{p} \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}_{p}, \mathbf{y}_{p})$$

linear combination of features

sum of part scores:

index p represents a part in the structure

Large Margin Estimation

• Given training example (x, y*), we want:

$$\text{arg max}_{\mathbf{y}} \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}) = \mathbf{y}^*$$

$$\mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}^*) > \mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}) \quad \forall \mathbf{y} \neq \mathbf{y}^*$$

$$\mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}^*) \geq \mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}) + \gamma \ell(\mathbf{y}^*, \mathbf{y}) \quad \forall \mathbf{y}$$

- Maximize margin γ
- Mistake weighted margin $\gamma \ell(\mathbf{y}^*, \mathbf{y})$

$$\ell(\mathbf{y}^*, \mathbf{y}) = \sum_i I(y_i^* \neq y_i)$$
 # of mistakes in y

*Taskar et al. 03

- Recall from SVMs:
 - Maximizing margin γ is equivalent to minimizing the square of the L2-norm of the weight vector \mathbf{w} :
- New objective function:

$$\begin{aligned} & \min_{\mathbf{w}} & \frac{1}{2} ||\mathbf{w}||^2 \\ & s.t. & \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}_i, \mathbf{y}_i) \geq \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}_i, \mathbf{y}_i') + \ell(\mathbf{y}_i, \mathbf{y}_i'), & \forall i, \mathbf{y}_i' \in \mathcal{Y}_i \end{aligned}$$

• We want:

```
\operatorname{argmax}_{\operatorname{word}} \mathbf{w}^{\mathsf{T}} \mathbf{f}(\mathbf{b} \cap \mathbf{e} \in \mathbf{w}) = \text{``brace''}
```

Equivalently:

```
\mathbf{w}^{\mathsf{T}}\mathbf{f}(\ \mathbf{b}^{\mathsf{CaCe}}, \text{"brace"}) > \mathbf{w}^{\mathsf{T}}\mathbf{f}(\ \mathbf{b}^{\mathsf{CaCe}}, \text{"aaaaa"})
\mathbf{w}^{\mathsf{T}}\mathbf{f}(\ \mathbf{b}^{\mathsf{CaCe}}, \text{"brace"}) > \mathbf{w}^{\mathsf{T}}\mathbf{f}(\ \mathbf{b}^{\mathsf{CaCe}}, \text{"aaaaab"})
...
\mathbf{w}^{\mathsf{T}}\mathbf{f}(\ \mathbf{b}^{\mathsf{CaCe}}, \text{"brace"}) > \mathbf{w}^{\mathsf{T}}\mathbf{f}(\ \mathbf{b}^{\mathsf{CaCe}}, \text{"zzzzzz"})
```

a lot!

Min-max Formulation

Brute force enumeration of constraints:

$$\begin{aligned} & \min \quad \frac{1}{2} ||\mathbf{w}||^2 \\ & \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}^*) \geq \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}) + \ell(\mathbf{y}^*, \mathbf{y}), \quad \forall \mathbf{y} \end{aligned}$$

- The constraints are exponential in the size of the structure
- Alternative: min-max formulation
 - add only the most violated constraint

$$\begin{aligned} \mathbf{y}' &= \underset{\mathbf{y} \neq \mathbf{y}^*}{\arg\max} [\mathbf{w}^\top \mathbf{f}(\mathbf{x}^i, \mathbf{y}) + \ell(\mathbf{y}^i, \mathbf{y})] \\ \text{add to QP}: \ \mathbf{w}^\top \mathbf{f}(\mathbf{x}^i, \mathbf{y}^i) &\geq \mathbf{w}^\top \mathbf{f}(\mathbf{x}^i, \mathbf{y}') + \ell(\mathbf{y}^i, \mathbf{y}') \end{aligned}$$

- Handles more general loss functions
- Only polynomial # of constraints needed

Min-max Formulation

$$\begin{aligned} & \min & \frac{1}{2}||\mathbf{w}||^2 \\ & \mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}^*) \geq \max_{\mathbf{y} \neq \mathbf{y}*} \ \mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}) + \ell(\mathbf{y}^*, \mathbf{y}) \end{aligned}$$

- Key step: convert the maximization in the constraint from discrete to continuous
 - This enables us to plug it into a QP

$$\max_{\mathbf{y} \neq \mathbf{y}^*} \ \mathbf{w}^\top \mathbf{f}(\mathbf{x}, \mathbf{y}) + \ell(\mathbf{y}^*, \mathbf{y}) \longleftrightarrow \max_{\mathbf{z} \in \mathcal{Z}} \ (\mathbf{F}^\top \mathbf{w} + \ell)^\top \mathbf{z}$$

discrete optim.

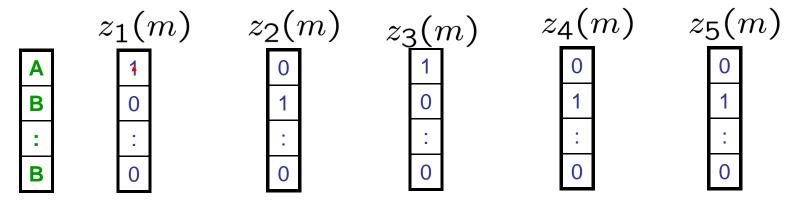

continuous optim.

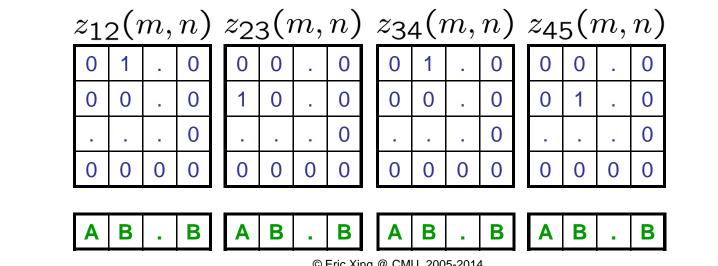

- How to do this conversion?
 - Linear chain example in the next slides →

$y \Rightarrow z$ map for linear chain structures

OCR example: y = 'ABABB';

z's are the indicator variables for the corresponding classes (alphabet)

$y \Rightarrow z$ map for linear chain structures

Rewriting the maximization function in terms of indicator variables:

$$\max_{\mathbf{z}} \sum_{j,m} z_{j}(m) \left[\mathbf{w}^{\top} \mathbf{f}_{\mathsf{node}}(\mathbf{x}_{j}, m) + \ell_{j}(m) \right] \\ + \sum_{jk,m,n} z_{jk}(m,n) \left[\mathbf{w}^{\top} \mathbf{f}_{\mathsf{edge}}(\mathbf{x}_{jk}, m, n) + \ell_{jk}(m,n) \right] \\ z_{k}(n) \qquad z_{j}(m) \geq 0; \ z_{jk}(m,n) \geq 0; \\ z_{j}(m) \qquad \mathsf{normalization} \ \sum_{m} z_{j}(m) = 1 \\ \boxed{0} \qquad \boxed{0} \ \boxed{0} \\ \boxed{0} \qquad \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \\ \boxed{0} \qquad \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \\ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \\ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \\ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \ \boxed{0} \\ \boxed{z_{jk}(m,n)} \qquad \mathsf{Az=b} \ (\mathbf{F}^{\top}\mathbf{w} + \ell)^{\top}\mathbf{z} \\ \boxed{z_{jk}(m,n)}$$

Min-max formulation

Original problem:

$$\begin{aligned} & \min & \frac{1}{2}||\mathbf{w}||^2 \\ & \mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}^*) \geq \max_{\mathbf{y}} \ \mathbf{w}^{\top}\mathbf{f}(\mathbf{x}, \mathbf{y}) + \ell(\mathbf{y}^*, \mathbf{y}) \end{aligned}$$

Transformed problem:

$$\begin{aligned} & \min \quad \frac{1}{2} ||\mathbf{w}||^2 \\ & \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}^*) \geq \max_{\substack{\mathbf{z} \geq 0; \\ \mathbf{A}\mathbf{z} = \mathbf{b};}} \mathbf{q}^{\top} \mathbf{z} \quad \text{where } \mathbf{q}^{\top} = \mathbf{w}^{\top} \mathbf{F} + \ell^{\top} \end{aligned}$$

- Has integral solutions z for chains, trees
- Can be fractional for untriangulated networks

Min-max formulation

Using strong Lagrangian duality:

(beyond the scope of this lecture)

$$\max_{\substack{\mathbf{z} \geq 0;\\ \mathbf{A}\mathbf{z} = \mathbf{b};}} \mathbf{q}^{\top}\mathbf{z} = \min_{\mathbf{A}^{\top}\mu \geq \mathbf{q}} \mathbf{b}^{\top}\mu$$

• Use the result above to minimize jointly over **w** and μ :

$$\begin{aligned} \min_{\mathbf{w},\mu} \ & \frac{1}{2} ||\mathbf{w}||^2 \\ \text{s.t.} \ & \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}^*) \geq \mathbf{b}^{\top} \mu; \\ & \mathbf{A}^{\top} \mu \geq \mathbf{q}; \end{aligned}$$

Min-max formulation

$$\begin{aligned} \min_{\mathbf{w},\mu} \ & \frac{1}{2} ||\mathbf{w}||^2 \\ \text{s.t.} \ & \mathbf{w}^{\top} \mathbf{f}(\mathbf{x}, \mathbf{y}^*) \geq \mathbf{b}^{\top} \mu; \\ & \mathbf{A}^{\top} \mu \geq (\mathbf{w}^{\top} \mathbf{F} + \ell)^{\top} \end{aligned}$$

Formulation produces compact QP for

- Low-treewidth Markov networks
- Associative Markov networks
- Context free grammars
- Bipartite matchings
- Any problem with compact LP inference

Results: Handwriting Recognition

MLE versus max-margin learning

- Likelihood-based estimation
 - Probabilistic (joint/conditional likelihood model)
 - Easy to perform Bayesian learning, and incorporate prior knowledge, latent structures, missing data
 - Bayesian or direct regularization
 - Hidden structures or generative hierarchy

- Max-margin learning
 - Non-probabilistic (concentrate on inputoutput mapping)
 - Not obvious how to perform Bayesian learning or consider prior, and missing data
 - Support vector property, sound theoretical guarantee with limited samples
 - Kernel tricks
- Maximum Entropy Discrimination (MED) (Jaakkola, et al., 1999)
 - Model averaging

$$\hat{y} = \operatorname{sign} \int p(\mathbf{w}) F(x; \mathbf{w}) \, d\mathbf{w}$$

$$(y \in \{+1, -1\})$$

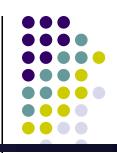

The optimization problem (binary classification)

$$\min_{p(\Theta)} KL(p(\Theta)||p_0(\Theta))$$

s.t.
$$\int p(\Theta)[y_i F(x; \mathbf{w}) - \xi_i] d\Theta \ge 0, \forall i,$$

where Θ is the parameter \mathbf{w} when ξ are kept fixed or the pair (\mathbf{w}, ξ) when we want to optimize over ξ

Maximum Entropy Discrimination Markov Networks

Structured MaxEnt Discrimination (SMED):

P1:
$$\min_{p(\mathbf{w}),\xi} KL(p(\mathbf{w})||p_0(\mathbf{w})) + U(\xi)$$
s.t. $p(\mathbf{w}) \in \mathcal{F}_1, \ \xi_i \ge 0, \forall i.$

generalized maximum entropy or regularized KL-divergence

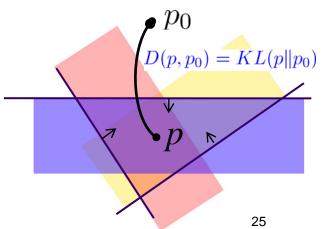

• Feasible subspace of weight distribution:

$$\mathcal{F}_1 = \{ p(\mathbf{w}) : \int p(\mathbf{w}) [\Delta F_i(\mathbf{y}; \mathbf{w}) - \Delta \ell_i(\mathbf{y})] d\mathbf{w} \ge -\xi_i, \ \forall i, \forall \mathbf{y} \ne \mathbf{y}^i \},$$

expected margin constraints.

Average from distribution of M³Ns

$$h_1(\mathbf{x}; p(\mathbf{w})) = \arg \max_{\mathbf{y} \in \mathcal{Y}(\mathbf{x})} \int p(\mathbf{w}) F(\mathbf{x}, \mathbf{y}; \mathbf{w}) d\mathbf{w}$$

Solution to MaxEnDNet

- Theorem:
 - Posterior Distribution:

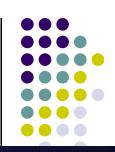

$$p(\mathbf{w}) = \frac{1}{Z(\alpha)} p_0(\mathbf{w}) \exp \left\{ \sum_{i, \mathbf{y}} \alpha_i(\mathbf{y}) [\Delta F_i(\mathbf{y}; \mathbf{w}) - \Delta \ell_i(\mathbf{y})] \right\}$$

– Dual Optimization Problem:

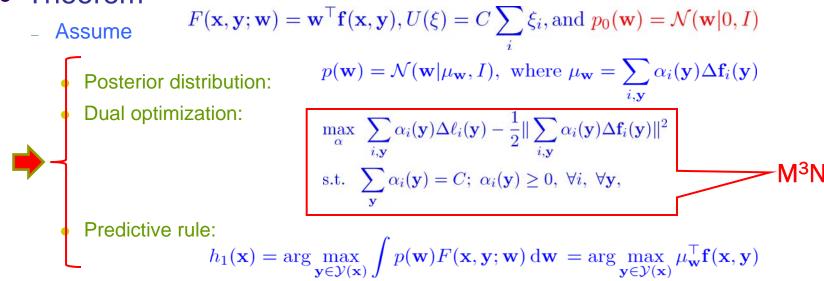

D1:
$$\max_{\alpha} -\log Z(\alpha) - U^{\star}(\alpha)$$
s.t. $\alpha_i(\mathbf{y}) \ge 0, \ \forall i, \ \forall \mathbf{y},$

 $U^{\star}(\cdot)$ is the conjugate of the $U(\cdot)$, i.e., $U^{\star}(\alpha) = \sup_{\xi} \left(\sum_{i,y} \alpha_i(y) \xi_i - U(\xi) \right)$

Gaussian MaxEnDNet (reduction to M³N)

Theorem

- Thus, MaxEnDNet subsumes M³Ns and admits all the merits of max-margin learning
- Furthermore, MaxEnDNet has at least three advantages ...

Three Advantages

 An averaging Model: PAC-Bayesian prediction error guarantee (Theorem 3)

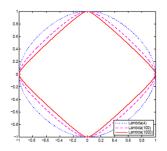

$$\Pr_{Q}(M(h, \mathbf{x}, \mathbf{y}) \le 0) \le \Pr_{\mathcal{D}}(M(h, \mathbf{x}, \mathbf{y}) \le \gamma) + O\left(\sqrt{\frac{\gamma^{-2}KL(p||p_0)\ln(N|\mathcal{Y}|) + \ln N + \ln \delta^{-1}}{N}}\right)$$

- Entropy regularization: Introducing useful biases
 - Standard Normal prior => reduction to standard M³N (we've seen it)
 - Laplace prior => Posterior shrinkage effects (sparse M³N)

$$\min_{\mu,\xi} \sqrt{\lambda} \sum_{k=1}^{K} \left(\sqrt{\mu_k^2 + \frac{1}{\lambda}} - \frac{1}{\sqrt{\lambda}} \log \frac{\sqrt{\lambda \mu_k^2 + 1} + 1}{2} \right) + C \sum_{i=1}^{N} \xi_i$$

s.t. $\mu^{\top} \Delta \mathbf{f}_i(\mathbf{y}) \ge \Delta \ell_i(\mathbf{y}) - \xi_i; \ \xi_i \ge 0, \ \forall i, \ \forall \mathbf{y} \ne \mathbf{y}^i.$

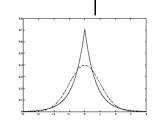

- Integrating Generative and Discriminative principles (next class)
 - Incorporate latent variables and structures (PoMEN)
 - Semisupervised learning (with partially labeled data)

• Laplace Prior: $p_0(\mathbf{w}) = \prod_{k=1}^K \frac{\sqrt{\lambda}}{2} e^{-\sqrt{\lambda}|w_k|} = (\frac{\sqrt{\lambda}}{2})^K e^{-\sqrt{\lambda}|\mathbf{w}|}$

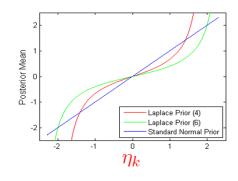

- Corollary 4:
 - Under a Laplace MaxEnDNet, the posterior mean of parameter vector w is:

$$\forall k, \ \langle w_k \rangle_p = \frac{2\eta_k}{\lambda - \eta_k^2}$$

where the vector η is a linear combination of "support vectors":

- The Gaussian MaxEnDNet and the regular M³N has no such shrinkage
 - there, we have

$$\langle \mathbf{w} \rangle_p = \eta \iff \forall k, \ \langle w_k \rangle_p = \eta_k$$

LapMEDN vs. L_2 and L_1 $\min_{\mu,\xi} |\mu| + C \sum_{i=1}^{N} \xi_i$ regularization

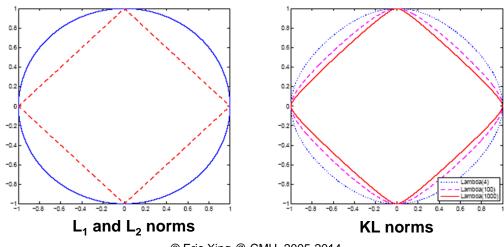

$$\begin{aligned} & \min_{\mu, \xi} \ |\mu| + C \sum_{i=1}^{N} \xi_i \\ & \text{s.t.} \ \mu^{\top} \Delta \mathbf{f}_i(\mathbf{y}) \geq \Delta \ell_i(\mathbf{y}) - \xi_i; \ \xi_i \geq 0, \ \forall i, \ \forall \mathbf{y} \neq \mathbf{y}^i. \end{aligned}$$

 Corollary 5: LapMEDN corresponding to solving the following primal optimization problem:

$$\min_{\mu,\xi} \sqrt{\lambda} \sum_{k=1}^{K} \left(\sqrt{\mu_k^2 + \frac{1}{\lambda}} - \frac{1}{\sqrt{\lambda}} \log \frac{\sqrt{\lambda \mu_k^2 + 1} + 1}{2} \right) + C \sum_{i=1}^{N} \xi_i$$

s.t. $\mu^{\top} \Delta \mathbf{f}_i(\mathbf{y}) \ge \Delta \ell_i(\mathbf{y}) - \xi_i; \ \xi_i \ge 0, \ \forall i, \ \forall \mathbf{y} \ne \mathbf{y}^i.$

• KL norm: $\|\mu\|_{KL} \triangleq \sum_{k=1}^K \left(\sqrt{\mu_k^2 + \frac{1}{\lambda}} - \frac{1}{\sqrt{\lambda}} \log \frac{\sqrt{\lambda \mu_k^2 + 1} + 1}{2} \right)$

Recall Primal and Dual Problems of M³Ns

Primal problem:

- **Algorithms**
 - **Cutting plane**
 - Sub-gradient

Dual problem:

D0 (M³N):
$$\max_{\alpha} \sum_{i,\mathbf{y}} \alpha_i(\mathbf{y}) \Delta \ell_i(\mathbf{y}) - \frac{1}{2} \eta^{\top} \eta$$

s.t. $\forall i, \ \forall \mathbf{y} : \sum_{\mathbf{y}} \alpha_i(\mathbf{y}) = C; \ \alpha_i(\mathbf{y}) \ge 0.$
where $\eta = \sum_{i,\mathbf{y}} \alpha_i(\mathbf{y}) \Delta \mathbf{f}_i(\mathbf{y}).$

- Algorithms:

 - **Exponentiated gradient**

$$\mathbf{w}^{\star} = \eta^{\star} = \sum_{i, \mathbf{y}} \alpha_i^{\star}(\mathbf{y}) \Delta \mathbf{f}_i(\mathbf{y}).$$

So, M³N is dual sparse!

$$\mathbf{y}^{\star} = h(\mathbf{x}) \triangleq \arg \max_{y} F(\mathbf{x}, \mathbf{y}; \mathbf{w})$$

Variational Learning of LapMEDN

Exact primal or dual function is hard to optimize

$$\min_{\mu,\xi} \sqrt{\lambda} \sum_{k=1}^{K} \left(\sqrt{\mu_k^2 + \frac{1}{\lambda}} - \frac{1}{\sqrt{\lambda}} \log \frac{\sqrt{\lambda \mu_k^2 + 1} + 1}{2} \right) + C \sum_{i=1}^{N} \xi_i \qquad \max_{\alpha} \sum_{i,\mathbf{y}} \alpha_i(\mathbf{y}) \Delta \ell_i(\mathbf{y}) - \sum_{k=1}^{K} \log \frac{\lambda}{\lambda - \eta_k^2} \\
\text{s.t. } \mu^{\mathsf{T}} \Delta \mathbf{f}_i(\mathbf{y}) \ge \Delta \ell_i(\mathbf{y}) - \xi_i; \ \xi_i \ge 0, \ \forall i, \ \forall \mathbf{y} \ne \mathbf{y}^i. \qquad \text{s.t. } \sum \alpha_i(\mathbf{y}) = C; \ \alpha_i(\mathbf{y}) \ge 0, \ \forall i, \ \forall \mathbf{y}.$$

Use the hierarchical representation of Lapiace prior, we get:

$$KL(p||p_0) = -H(p) - \langle \log \int p(\mathbf{w}|\tau)p(\tau|\lambda) \, d\tau \rangle_p$$

$$\leq -H(p) - \langle \int q(\tau) \log \frac{p(\mathbf{w}|\tau)p(\tau|\lambda)}{q(\tau)} \, d\tau \rangle_p \triangleq \mathcal{L}(p(\mathbf{w}), q(\tau))$$

We optimize an upper bound:
$$\min_{p(\mathbf{w}) \in \mathcal{F}_1; q(\tau); \xi} \mathcal{L}(p(\mathbf{w}), q(\tau)) + U(\xi)$$

- Why is it easier?
 - Alternating minimization leads to nicer optimization problems

Keepq(au) fixed	Keep $p(\mathbf{w})$ fixed
- The effective prior is normal	- Closed form solution $\mathrm{o}q(\tau)$ and its expectation
- The effective prior is normal $\forall k: \ p_0(w_k \tau_k) = \text{Ation}_k 0, \langle \frac{1}{\tau_k} \rangle_{q(\tau)}^{-1})$ @ Eric X	$\langle \frac{1}{\tau_k} \rangle_q = \sqrt{\frac{1}{\sqrt{w_k^2}}}$ Closed-form $\langle w_k^2 \rangle_p$

Algorithmic issues of solving M³Ns

Primal problem:

P0 (M³N):
$$\min_{\mathbf{w},\xi} \frac{1}{2} ||\mathbf{w}||^2 + C \sum_{i=1}^{N} \xi_i$$

s.t. $\forall i, \forall \mathbf{y} \neq \mathbf{y}^i : \mathbf{w}^{\top} \Delta \mathbf{f}_i(\mathbf{y}) \geq \Delta \ell_i(\mathbf{y}) - \xi_i,$
 $\xi_i \geq 0$,

Algorithms

- Cutting plane
- Sub-gradient
- ...

Dual problem:

D0 (M³N):
$$\max_{\alpha} \sum_{i,\mathbf{y}} \alpha_i(\mathbf{y}) \Delta \ell_i(\mathbf{y}) - \frac{1}{2} \eta^{\top} \eta$$

s.t. $\forall i, \ \forall \mathbf{y} : \sum_{\mathbf{y}} \alpha_i(\mathbf{y}) = C; \ \alpha_i(\mathbf{y}) \ge 0.$
where $\eta = \sum_{i,\mathbf{y}} \alpha_i(\mathbf{y}) \Delta \mathbf{f}_i(\mathbf{y}).$

- Algorithms:
 - SMO
 - Exponentiated gradient
 - .

Nonlinear Features with Kernels

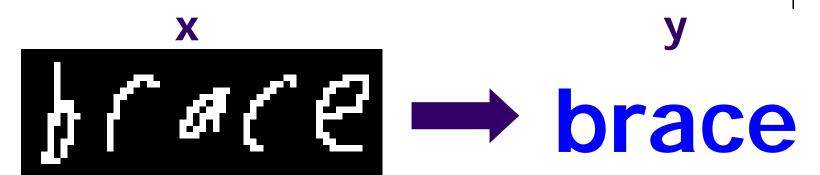

- Generative entropic kernels [Martins et al, JMLR 2009]
- Nonparametric RKHS embedding of rich distributions [on going]

Approximate decoders for global features

Experimental results on OCR datasets

Structured output

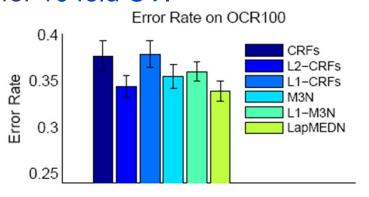

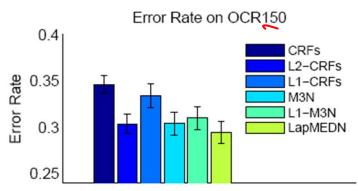

Experimental results on OCR datasets

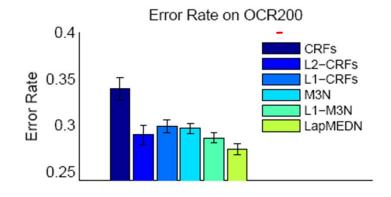

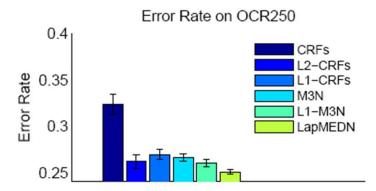

(CRFs, $L_1 - \text{CRFs}$, $L_2 - \text{CRFs}$, $M^3 \text{Ns}$, $L_1 - M^3 \text{Ns}$, and LapMEDN)

 We randomly construct OCR100, OCR150, OCR200, and OCR250 for 10 fold CV.

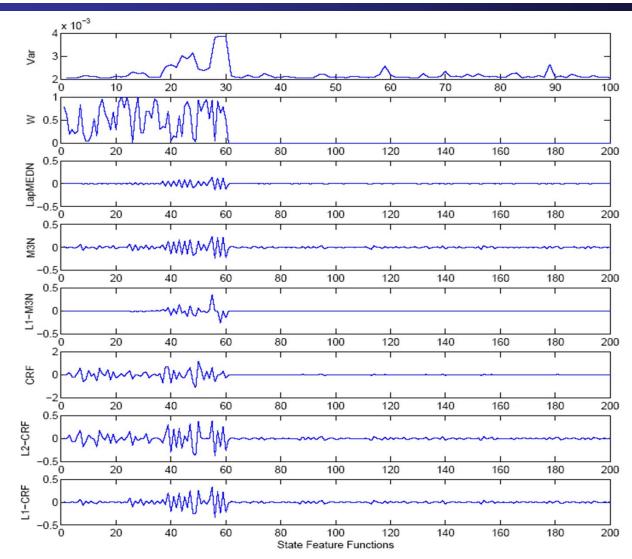

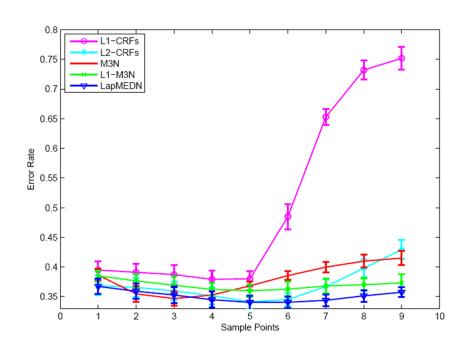

Feature Selection

Sensitivity to Regularization Constants

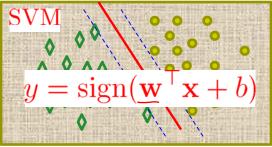

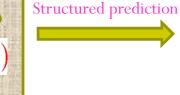

- \Box L_1 -CRF and L_2 -CRF:
- 0.001, 0.01, 0.1, 1, 4, 9, 16
- ☐ M³N and LapM³N:
- 1, 4, 9, 16, 25, 36, 49, 64, 81

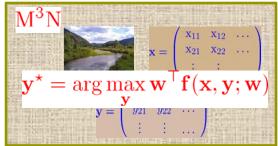

- *L*₁-CRFs are much sensitive to regularization constants; the others are more stable
- LapM³N is the most stable one

Summary: Margin-based Learning Paradigms

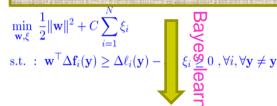

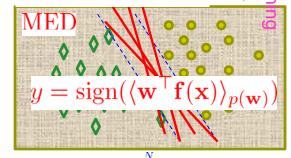

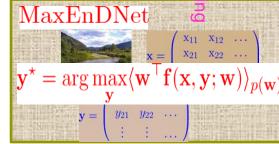

$$\min_{\mathbf{w}, \xi} \frac{1}{2} \mathbf{w}^{\top} \mathbf{w} + C \sum_{i=1}^{N} \xi_{i};$$
s.t. $y_{i}(\mathbf{w}^{\top} \mathbf{x}_{i} + b) \ge 1 - \xi_{i}, \ \forall i.$

$$\min_{p,\xi} KL(p||p_0) + C \sum_{i=1} \xi_i;$$

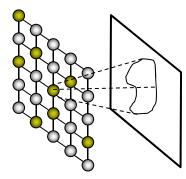

s.t. $y_i \langle \mathbf{f}(\mathbf{x}_i) \rangle_{p(\mathbf{w})} \ge 1 - \xi_i, \ \forall i.$

$$\min_{p(\mathbf{w}),\xi} KL(p||p_0) + U(\xi)$$

s.t.
$$\int p(\mathbf{w})[\Delta F_i(\mathbf{y}; \mathbf{w}) - \Delta \ell_i(\mathbf{y})] d\mathbf{w} \ge -\xi_i, \ \xi_i \ge 0, \ \forall i, \forall \mathbf{y} \ne \mathbf{y}^i.$$

Open Problems

- Unsupervised CRF learning and MaxMargin Learning
 - Only X, but not Y (sometimes part of Y), is available
 - We want to recognize a pattern that is maximally different from the rest!

• What does margin or conditional likelihood mean in these cases? Given only $\{X_n\}$, how can we define the cost function?

$$margin = w^{T} (F(y_n, x_n) - F(y'_n, x_n))$$

$$p_{\theta}(y \mid x) = \frac{1}{Z(\theta, x)} \exp \left\{ \sum_{c} \theta_{c} f_{c}(x, y_{c}) \right\}$$

- Algorithmic challenge
- Stay tuned for lecture 29!

Remember: Elements of Learning

- Here are some important elements to consider before you start:
 - Task:
 - Embedding? Classification? Clustering? Topic extraction? ...
 - Data and other info:
 - Input and output (e.g., continuous, binary, counts, ...)
 - Supervised or unsupervised, of a blend of everything?
 - Prior knowledge? Bias?
 - Models and paradigms:
 - BN? MRF? Regression? SVM?
 - Bayesian/Frequents? Parametric/Nonparametric?
 - Objective/Loss function:
 - MLE? MCLE? Max margin?
 - Log loss, hinge loss, square loss? ...
 - Tractability and exactness trade off:
 - Exact inference? MCMC? Variational? Gradient? Greedy search?
 - Online? Batch? Distributed?
 - Evaluation:
 - Visualization? Human interpretability? Perperlexity? Predictive accuracy?
- It is better to consider one element at a time!
