## Algorithms: Assignment 6

Due date: October 26 (Thursday)

## Problem 1 (4 points)

Suppose that we apply RB-INSERT to add a node to a red-black tree, and then immediately call RB-Delete to remove this node. Can the resulting tree differ from the initial tree? If the new tree is always the same as the initial tree, explain why; if not, give an example of a situation when it is different.

## Problem 2 (6 points)

This problem is inherited from the midterm; you should write a solution even if you received the full credit for solving it during the midterm.

Let T(n) be the number of distinct binary trees with n nodes.

- (a) Prove that  $T(n) = \Omega(2^n)$ .
- **(b)** Prove that  $T(n) = \Omega(3^n)$ .

## Problem 3 (bonus)

This is an optional problem, which is also from the midterm. It allows you to get 2 bonus points toward your final grade.

Determine an asymptotically tight bound for the running time of the following algorithm, and give a derivation of your bound:

```
Number-Typer(n)
if n \le 1
return
for i = 1 to n
do print i
for i = 1 to n - 1
do Number-Typer(i)
```
