## Automatic Category Label Coarsening for Syntax-Based Machine Translation

Greg Hanneman and Alon Lavie
Language Technologies Institute Carnegie Mellon University

Fifth Workshop on Syntax and Structure in Statistical Translation June 23, 2011

## CarnegieMellon

## Motivation

- SCFG-based MT:
- Training data annotated with constituency parse trees on both sides
- Extract labeled SCFG rules
$\mathrm{A}:: \mathrm{JJ} \rightarrow$ [bleues] $]:[$ blue $]$
$\mathrm{NP}:: \mathrm{NP} \rightarrow\left[\mathrm{D}^{1} \mathrm{~N}^{2} \mathrm{~A}^{3}\right]::\left[\mathrm{DT}^{1} \mathrm{JJ}^{3} \mathrm{NNS}^{2}\right]$
- We think syntax on both sides is best
- But joint default label set is too large

## Motivation

－Labeling ambiguity：
－Same RHS with many LHS labels

$$
\begin{aligned}
& \mathrm{JJ}:: \mathrm{JJ} \rightarrow[\text { 快速 }]::[\text { fast }] \\
& \mathrm{AD}:: \mathrm{JJ} \rightarrow[\text { 快速 }]::[\text { fast }] \\
& \mathrm{JJ}:: \mathrm{RB} \rightarrow[\text { [ 快速 }]::[\text { fast }] \\
& \mathrm{VA}:: \mathrm{JJ} \rightarrow[\text { 快速 }]::[\text { fast }] \\
& \mathrm{VP}:: \mathrm{ADJP} \rightarrow\left[\mathrm{VV}^{1} \mathrm{VV}^{2}\right]::\left[\mathrm{RB}^{1} \mathrm{VBN}^{2}\right] \\
& \mathrm{VP}:: \mathrm{VP} \rightarrow\left[\mathrm{VV}^{1} \mathrm{VV}^{2}\right]::\left[\mathrm{RB}^{1} \mathrm{VBN}^{2}\right]
\end{aligned}
$$

## Motivation

－Rule sparsity：
－Label mismatch blocks rule application
$\mathrm{VP}:: \mathrm{VP} \rightarrow\left[\mathrm{VV}^{1}\right.$ 了 $\mathrm{PP}^{2}$ 的 $\left.\mathrm{NN}^{3}\right]::\left[\mathrm{VBD}^{1}\right.$ their $\left.\mathrm{NN}^{3} \mathrm{PP}^{2}\right]$
$\mathrm{VP}:: \mathrm{VP} \rightarrow\left[\mathrm{VV}^{1}\right.$ 了 $\mathrm{PP}^{2}$ 的 $\left.\mathrm{NN}^{3}\right]::\left[\mathrm{VB}^{1}\right.$ their $\left.\mathrm{NNS}^{3} \mathrm{PP}^{2}\right]$
$\sqrt{ }$ saw their friend from the conference
$\sqrt{ }$ see their friends from the conference
$X$ saw their friends from the conference

## Motivation

- Solution: modify the label set
- Preference grammars [Venugopal et al. 2009]
- X rule specifies distribution over SAMT labels
- Avoids score fragmentation, but original labels still used for decoding
- Soft matching constraint [Chiang 2010]
- Substitute A::Z at B::Y with model cost subst(B, A) and subst(Y, Z)
- Avoids application sparsity, but must tune each subst $\left(\mathrm{s}_{1}, \mathrm{~s}_{2}\right)$ and $\operatorname{subst}\left(\mathrm{t}_{1}, \mathrm{t}_{2}\right)$ separately

## Our Approach

- Difference in translation behavior $\Rightarrow$ different category labels

la grande voiture<br>la plus grande voiture<br>la voiture la plus grande<br>the large car<br>the larger car<br>the largest car

- Simple measure: how category is aligned to other language

$$
\begin{aligned}
& \text { A:: JJ } \rightarrow \text { [grande]::[large] } \\
& \text { AP::JJR } \rightarrow \text { [plus grande]::[larger] }
\end{aligned}
$$

## Label Collapsing Algorithm

- Extract baseline grammar from aligned tree pairs (e.g. Lavie et al. [2008])
- Compute label alignment distributions
- Repeat until stopping point:
- Compute $L_{1}$ distance between all pairs of source and target labels
- Merge the label pair with smallest distance
- Update label alignment distributions

## Experiment 1

- Goal: Explore effect of collapsing with respect to stopping point
- Data: Chinese-English FBIS corpus (302 k)

## Experiment 1

## Experiment 1

## Effect on Label Set

- Number of unique labels in grammar

|  | Zh | En | Joint |
| :--- | ---: | ---: | ---: |
| Baseline | 55 | 71 | 1556 |
| Iter. 29 | 46 | 51 | 1035 |
| Iter. 45 | 38 | 44 | 755 |
| Iter. 60 | 33 | 34 | 558 |
| Iter. 81 | 24 | 22 | 283 |
| Iter. 99 | 14 | 14 | 106 |

## Effect on Grammar

－Split grammar into three partitions：
－Phrase pair rules

$$
\mathrm{NN}:: \mathrm{NN} \rightarrow \text { [ 友好 ] } \because:[\text { friendship] }
$$

－Partially lexicalized grammar rules

$$
\mathrm{NP}:: \mathrm{NP} \rightarrow\left[2000 \text { 年 } \mathrm{NN}^{1}\right] \because:\left[\text { the } 2000 \mathrm{NN}^{1}\right]
$$

－Fully abstract grammar rules

$$
\mathrm{VP}:: \mathrm{ADJP} \rightarrow\left[\mathrm{VV}^{1} \mathrm{VV}^{2}\right]::\left[\mathrm{RB}^{1} \mathrm{VBN}^{2}\right]
$$

## Effect on Grammar

- Phrase $\diamond$ Part Lex $\nabla$ Abstract $-\Delta$ Total

## Effect on Metric Scores

- NIST MT '03 Chinese-English test set
- Results averaged over four tune/test runs

|  | BLEU | METR | TER |
| :--- | ---: | ---: | ---: |
| Baseline | 24.43 | 54.77 | 68.02 |
| Iter. 29 | 27.31 | 55.27 | 63.24 |
| Iter. 45 | 27.10 | 55.24 | 63.41 |
| Iter. 60 | 27.52 | 55.32 | 62.67 |
| Iter. 81 | 26.31 | 54.63 | 63.53 |
| Iter. 99 | 25.89 | 54.76 | 64.82 |

## Effect on Decoding

- Different outputs produced
- Collapsed 1-best in baseline 100-best: 3.5\%
- Baseline 1-best in collapsed 100-best: 5.0\%
- Different hypergraph entries explored in cube pruning
- 90\% of collapsed entries not in baseline
- Overlapping entries tend to be short
- Hypothesis: different rule possibilities lead search in complementary direction

## Experiment 2

- Goal: Explore effect of collapsing across language pairs
- Data: Chinese-English FBIS corpus, French-English WMT 2010 data

## Experiment 2

- Goal: Explore effect of collapsing across language pairs
- Data: Chinese-English FBIS corpus, French-English WMT 2010 data

## Effect on English Collapsing

- Adverbs
- Zh-En: RB, RBR
-Fr-En: RBR, RBS
- Verbs
- Zh-En: VB, VBG, VBN
-Fr-En: VB, VBD, VBN, VBP, VBZ, MD
- Wh-phrases
- Zh-En: ADJP, WHADJP; ADVP, WHADVP
- Fr-En: PP, WHPP

## Effect on Label Set

- Full subtype collapsing

- Partial subtype collapsing

- Combination by syntactic function RRC WHADJP INTJ

## Conclusions

- Can effectively coarsen labels based on alignment distributions
- Significantly improved metric scores at all attempted stopping points
- Reduces rule sparsity more than labeling ambiguity
- Points decoder in different direction
- Different results for different language pairs or grammars

## Future Work

- Take rule context into account $[\mathrm{NP}:: \mathrm{NP}] \rightarrow\left[\mathrm{D}^{1} \mathrm{~N}^{2}\right]::\left[\mathrm{DT}^{1} \mathrm{NN}^{2}\right] \quad$ la voiture / the car $[\mathrm{NP}:: \mathrm{NP}] \rightarrow\left[\right.$ les $\left.\mathrm{N}^{2}\right]::\left[\mathrm{NNS}^{2}\right] \quad$ les voitures / cars
- Try finer-grained label sets [Petrov et al. 2006]

NP NP-0, NP-1, ..., NP-30
VBN VBN-0, VBN-1, ..., VBN-25
RBS RBS-0

- Non-greedy collapsing
