Graphical Models meet Margin-based Learning

Machine Learning – 10701/15781

Carlos Guestrin

Carnegie Mellon University

April 13th, 2005

Next few lectures

- Today – Advanced topic in graphical models
- Next week – learning to make decisions with reinforcement learning
- Week after – Dealing with very large datasets, active learning and BIG PICTURE

Handwriting Recognition

Character recognition: kernel SVMs

Support Vector Machines

Advantages:	SVM
High-dim learning (kernels)	✓
Generalization bounds	✓

Handwriting Recognition 2

SVMs for sequences?

Problem: # of classes exponential in length

length word 5:

brare
zzzzz brick
aaaaa
..... brake
brace

A diagram illustrating the exponential growth of possible sequences. It shows a sequence of characters: 'brare', 'zzzzz', 'aaaaa', and '.....'. Arrows indicate transitions between these sequences, with 'brace' and 'brake' shown as possible continuations. The text '26^5 - 1' is also present, indicating the total number of possible sequences of length 5.

Handwriting Recognition 2

Graphical models: HMMs, MNs

HMM Linear in length Markov Network

SVMs vs. MNs

Advantages:	SVM	MN
High-dim learning (kernels)	✓	✗
Generalization bounds	✓	✗
Efficiently exploit label correlations	✗	✓

SVMs, MNs vs. M³Ns

Advantages:	SVM	MN	M ³ N
High-dim learning (kernels)	✓	✗	✓
Generalization bounds	✓	✗	✓
Efficiently exploit label correlations	✗	✓	✓

convex f:

HMM:

$$P(y, x) = P(y_1) \left[\prod_{i=1}^n P(o_i | y_i) \right] \left[\prod_{i=2}^n P(y_i | y_{i-1}) \right]$$

obs. prob. transition model

Chain Markov Net (aka CRF*)

word images

$$P(\mathbf{y} | \mathbf{x}) = \frac{1}{Z(\mathbf{x})} \prod_i \phi(\mathbf{x}_i, y_i) \prod_i \phi(y_i, y_{i+1})$$

normalization constant

$\phi(\cdot) \geq 0$
potential function

$$\phi(\mathbf{x}_i, y_i) = \exp\{\sum_{\alpha} w_{\alpha} f_{\alpha}(\mathbf{x}_i, y_i)\}$$

linear function

$$\phi(y_i, y_{i+1}) = \exp\{\sum_{\beta} w_{\beta} f_{\beta}(y_i, y_{i+1})\}$$

$$e^{\sum_{\alpha} w_{\alpha} f_{\alpha}} \cdot e^{\sum_{\beta} w_{\beta} f_{\beta}} = e^{\sum_{\alpha} w_{\alpha} f_{\alpha} + \sum_{\beta} w_{\beta} f_{\beta}}$$

Chain Markov Net (aka CRF*)

$$P(\mathbf{y} | \mathbf{x}) = \frac{1}{Z(\mathbf{x})} \underbrace{\prod_i \phi(\mathbf{x}_i, y_i)}_{\text{log-linear model}} \underbrace{\prod_i \phi(y_i, y_{i+1})}_{\text{log-linear model}} = \frac{1}{Z(\mathbf{x})} \exp\{\mathbf{w}^T \mathbf{f}(\mathbf{x}, \mathbf{y})\}$$

$$\prod_i \phi(\mathbf{x}_i, y_i) = \exp\{\sum_{\alpha} \mathbf{w}_{\alpha} \sum_i f_{\alpha}(\mathbf{x}_i, y_i)\} = \exp\{\sum_{\alpha} w_{\alpha} f_{\alpha}(\mathbf{x}, \mathbf{y})\}$$

$$\prod_i \phi(y_i, y_{i+1}) = \exp\{\sum_{\beta} w_{\beta} \sum_i f_{\beta}(y_i, y_{i+1})\} = \exp\{\sum_{\beta} w_{\beta} f_{\beta}(\mathbf{y})\}$$

$$f_{\beta}(\mathbf{x}, \mathbf{y}) = \#(y = 'z', y' = 'a')$$

$$f_{\alpha}(\mathbf{x}, \mathbf{y}) = \#(x_p = 1, y = 'z')$$

Max (Conditional) Likelihood

$$P_w(y|x) = \frac{1}{Z(x)} e^{w^T f(x,y)}$$

Estimation

$$\begin{aligned} &\text{maximize}_w \\ &\sum_{\mathbf{x} \in D} \log P_w(\mathbf{t}(\mathbf{x}) | \mathbf{x}) \end{aligned}$$

Classification

$$\arg \max_{\substack{y \\ \text{word}}} w^T f(\mathbf{x}, y)$$

image (handwritten note pointing to $f(\mathbf{x}, y)$)

$$\log P_w(y | \mathbf{x}) = w^T f(\mathbf{x}, y) - \log Z_w(\mathbf{x})$$

doesn't matter in argmax (handwritten note pointing to $\log Z_w(\mathbf{x})$)

Don't need to learn entire distribution!

OCR Example

- We want:

$$\operatorname{argmax}_{\text{word}} \mathbf{w}^T \mathbf{f}(\text{brace}, \text{word}) = \text{"brace"}$$

- Equivalently:

$$\mathbf{w}^T \mathbf{f}(\text{brace}, \text{"brace"}) > \mathbf{w}^T \mathbf{f}(\text{brace}, \text{"aaaaaa"})$$

$$\mathbf{w}^T \mathbf{f}(\text{brace}, \text{"brace"}) > \mathbf{w}^T \mathbf{f}(\text{brace}, \text{"aaaab"})$$

...

$$\mathbf{w}^T \mathbf{f}(\text{brace}, \text{"brace"}) > \mathbf{w}^T \mathbf{f}(\text{brace}, \text{"zzzzz"})$$

a lot!

$26^5 - 1$

Max Margin Estimation

- Goal: find \mathbf{w} such that

$$\mathbf{w}^T \mathbf{f}(\mathbf{x}, \overset{\text{true}}{t(\mathbf{x})}) > \mathbf{w}^T \mathbf{f}(\mathbf{x}, \underset{\text{every other } y}{y}) \quad \forall \mathbf{x} \in D \quad \forall y \neq t(\mathbf{x})$$
$$\mathbf{w}^T [\mathbf{f}(\mathbf{x}, t(\mathbf{x})) - \mathbf{f}(\mathbf{x}, y)] > 0$$

$$\mathbf{w}^T \Delta \mathbf{f}_x(\mathbf{y}) \geq \gamma \Delta t_x(\mathbf{y})$$

- Maximize margin γ
- Gain over \mathbf{y} grows with # of mistakes in \mathbf{y} : $\Delta t_x(\mathbf{y})$

$$\Delta t_{\text{brace}}(\text{"craze"}) = 2$$

$$\Delta t_{\text{brace}}(\text{"zzzzz"}) = 5$$

$$\mathbf{w}^T \Delta \mathbf{f}_{\text{brace}}(\text{"craze"}) \geq 2\gamma$$

$$\mathbf{w}^T \Delta \mathbf{f}_{\text{brace}}(\text{"zzzzz"}) \geq 5\gamma$$

M³Ns

$\mathbf{f}(\mathbf{x}, \mathbf{y})$

Estimation

$$\max_{\|w\| \leq 1} \gamma$$
$$w^\top \Delta \mathbf{f}_x(\mathbf{y}) \geq \gamma \Delta \mathbf{t}_x(\mathbf{y})$$

Classification

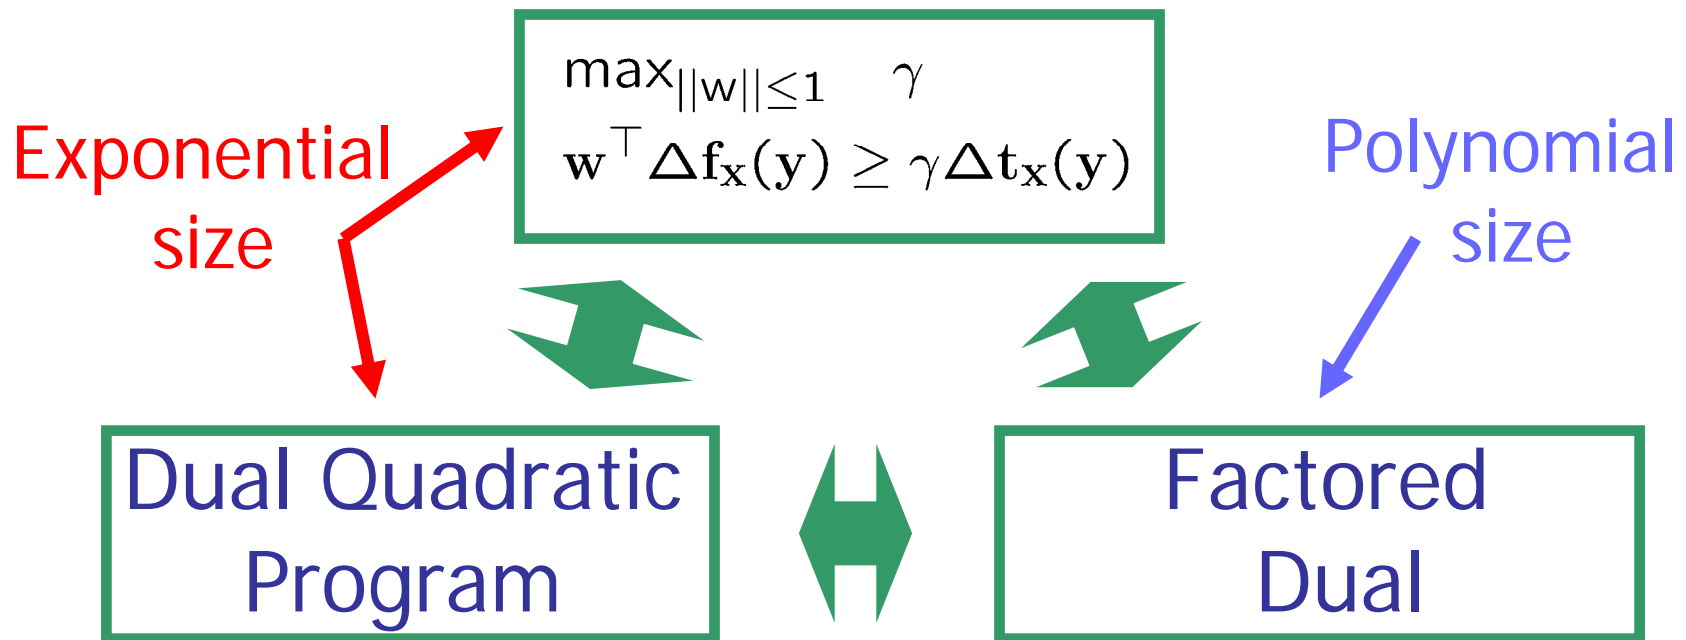

$$\arg \max_y w^\top \mathbf{f}(\mathbf{x}, \mathbf{y})$$

new image

wordy

M³Ns

Estimation

M³N Dual

$$\mathbf{w}^\top \Delta \mathbf{f}_{\text{brace}}(\text{"craze"}) \geq 2\gamma \quad \longrightarrow \quad \alpha_{\text{brace}}(\text{"craze"})$$

$$\mathbf{w}^\top \Delta \mathbf{f}_{\text{brace}}(\text{"zzzzz"}) \geq 5\gamma \quad \longrightarrow \quad \alpha_{\text{brace}}(\text{"zzzzz"})$$

$$\begin{aligned} \max_{\alpha} \quad & \sum_{\mathbf{x}} \sum_{\mathbf{y}} \alpha_{\mathbf{x}}(\mathbf{y}) \Delta \mathbf{t}_{\mathbf{x}}(\mathbf{y}) - \frac{1}{2} \sum_{\mathbf{x}, \mathbf{x}'} \sum_{\mathbf{y}, \mathbf{y}'} \alpha_{\mathbf{x}}(\mathbf{y}) \alpha_{\mathbf{x}'}(\mathbf{y}') \Delta \mathbf{f}_{\mathbf{x}}(\mathbf{y})^\top \Delta \mathbf{f}_{\mathbf{x}'}(\mathbf{y}') \\ \text{s.t.} \quad & \sum_{\mathbf{y}} \alpha_{\mathbf{x}}(\mathbf{y}) = 1 \text{ and } \alpha_{\mathbf{x}}(\mathbf{y}) \geq 0 \quad \forall \mathbf{x} \in D \quad \forall \mathbf{y} \end{aligned}$$

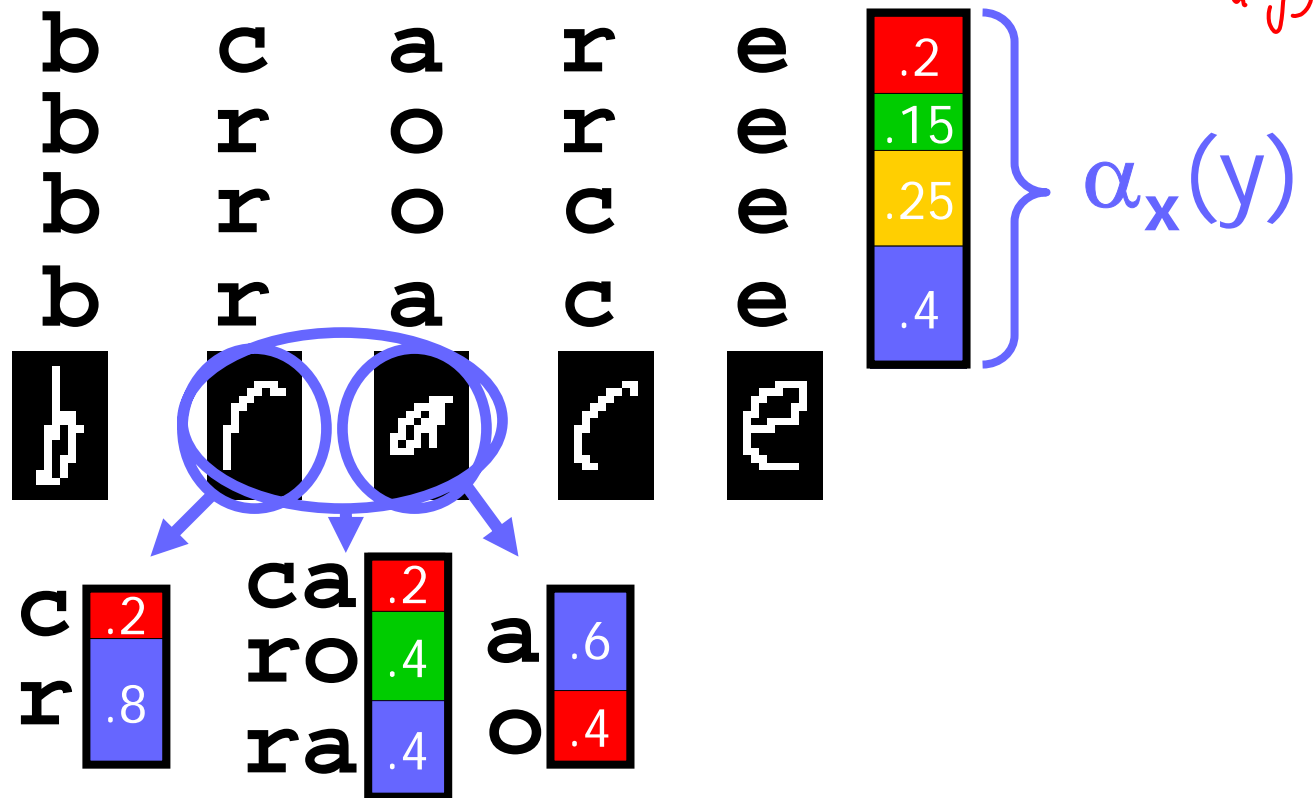

26^5
 $\alpha_{\mathbf{x}}(\mathbf{y})$ $|\mathbf{y}| = 26^5$

- **Exponential** number of variables
 - $\alpha_{\mathbf{x}}(\mathbf{y})$ represents a **probability distribution**
- Key insight from graphical models:
 - Can use network **structure** to **factorize** distribution

Dual = Probability Distribution

$$\max_{\alpha} \sum_{\mathbf{x}} \sum_{\mathbf{y}} \alpha_{\mathbf{x}}(\mathbf{y}) \Delta \mathbf{t}_{\mathbf{x}}(\mathbf{y}) - \frac{1}{2} \sum_{\mathbf{x}, \mathbf{x}'} \sum_{\mathbf{y}, \mathbf{y}'} \alpha_{\mathbf{x}}(\mathbf{y}) \alpha_{\mathbf{x}'}(\mathbf{y}') \Delta \mathbf{f}_{\mathbf{x}}(\mathbf{y})^{\top} \Delta \mathbf{f}_{\mathbf{x}'}(\mathbf{y}')$$

$$\text{s.t. } \sum_{\mathbf{y}} \alpha_{\mathbf{x}}(\mathbf{y}) = 1 \text{ and } \alpha_{\mathbf{x}}(\mathbf{y}) \geq 0 \quad \forall \mathbf{x} \in D \quad \forall \mathbf{y}$$

Factored Dual Variables

- Introduce **factored** dual variables:

$$\mu_i(y_i) \equiv \sum_{\mathbf{y} \sim y_i} \alpha(\mathbf{y}) \quad \mu_{ij}(y_i, y_j) \equiv \sum_{\mathbf{y} \sim y_i, y_j} \alpha(\mathbf{y})$$

- **Linear** in the size of the network
- Rewrite dual using μ 's:
 maximize QuadraticObjective(μ)
 s.t. $\mu \in \text{ConsistentMarginals}$ (linear constraints)

Equivalent to original dual!

Factored Objective

$$\underbrace{\sum_y \alpha(y) \Delta t(y)}_{E_\alpha[\Delta t(y)]} - \frac{1}{2} \sum_{y, y'} \alpha(y) \alpha(y') \Delta f(y)^\top \Delta f(y')$$

$$E_\alpha[\Delta t(y)]$$

$$\Delta t(y) = \sum_i \Delta t(y_i)$$

$$E_\alpha[\Delta t(y)] = E_\mu[\Delta t(y)]$$

Factored Objective

$$\underbrace{\sum_{\mathbf{y}} \alpha(\mathbf{y}) \Delta \mathbf{t}(\mathbf{y})}_{E_{\alpha}[\Delta \mathbf{t}(\mathbf{y})]} - \frac{1}{2} \underbrace{\sum_{\mathbf{y}, \mathbf{y}'} \alpha(\mathbf{y}) \alpha(\mathbf{y}') \Delta \mathbf{f}(\mathbf{y})^{\top} \Delta \mathbf{f}(\mathbf{y}')}_{E_{\alpha}[\Delta \mathbf{f}(\mathbf{y})]^{\top} E_{\alpha}[\Delta \mathbf{f}(\mathbf{y})]}$$
$$E_{\alpha}[\Delta \mathbf{t}(\mathbf{y})] - \frac{1}{2} E_{\alpha}[\Delta \mathbf{f}(\mathbf{y})]^{\top} E_{\alpha}[\Delta \mathbf{f}(\mathbf{y})]$$

$$\Delta \mathbf{t}(\mathbf{y}) = \sum_i \Delta \mathbf{t}(y_i)$$

$$\Delta \mathbf{f}(\mathbf{y}) = \sum_i \Delta \mathbf{f}(y_i) + \sum_{ij} \Delta \mathbf{f}(y_i, y_j)$$

$$E_{\alpha}[\Delta \mathbf{t}(\mathbf{y})] = E_{\mu}[\Delta \mathbf{t}(\mathbf{y})]$$

$$E_{\alpha}[\Delta \mathbf{f}(\mathbf{y})] = E_{\mu}[\Delta \mathbf{f}(\mathbf{y})]$$

$$E_{\mu}[\Delta \mathbf{t}(\mathbf{y})] - \frac{1}{2} E_{\mu}[\Delta \mathbf{f}(\mathbf{y})]^{\top} E_{\mu}[\Delta \mathbf{f}(\mathbf{y})]$$

Factored Constraints

$$\sum_{\mathbf{y}} \alpha(\mathbf{y}) = 1 \quad \text{normalization}$$

$$\alpha(\mathbf{y}) \geq 0 \quad \text{non-negativity}$$

If network is a tree
Else add clique tree constraints

$$\sum_{y_i} \mu(y_i) = 1$$

$$\mu(y_i) \geq 0$$

$$\sum_{y_i, y_j} \mu(y_i, y_j) = 1$$

$$\mu(y_i, y_j) \geq 0$$

$$\mu(y_i) = \sum_{y_j} \mu(y_i, y_j)$$

$$\mu(\cdot) \in \text{CliqueTreePolytope}$$

normalization

non-negativity

agreement

triangulation

Factored Dual

$$\begin{aligned} \max_{\mu} \quad & \sum_{\mathbf{x}} E_{\mu_{\mathbf{x}}}[\Delta \mathbf{t}_{\mathbf{x}}(\mathbf{y})] - \frac{1}{2} \sum_{\mathbf{x}, \mathbf{x}'} E_{\mu_{\mathbf{x}}}[\Delta \mathbf{f}_{\mathbf{x}}(\mathbf{y})]^{\top} E_{\mu_{\mathbf{x}'}}[\Delta \mathbf{f}_{\mathbf{x}'}(\mathbf{y}')] \\ \text{s.t.} \quad & \sum_{\mathbf{y}_i} \mu_{\mathbf{x}}(\mathbf{y}_i) = 1 \quad \mu_{\mathbf{x}}(\mathbf{y}_i, \mathbf{y}_j) \geq 0 \quad \mu_{\mathbf{x}}(\mathbf{y}_i) = \sum_{\mathbf{y}_j} \mu_{\mathbf{x}}(\mathbf{y}_i, \mathbf{y}_j) \\ & \mu_{\mathbf{x}}(\cdot) \in \text{CliqueTreePolytope}_{\mathbf{x}} \end{aligned}$$

- Objective is quadratic in network size
- Constraint set is exponential in tree-width
 - Linear for sequences and trees
 - Complexity same as inference and max likelihood

Factored Dual

$$\max_{\mu} \sum_{\mathbf{x}} E_{\mu_{\mathbf{x}}}[\Delta \mathbf{t}_{\mathbf{x}}(\mathbf{y})] - \frac{1}{2} \sum_{\mathbf{x}, \mathbf{x}'} \underbrace{E_{\mu_{\mathbf{x}}}[\Delta \mathbf{f}_{\mathbf{x}}(\mathbf{y})]^{\top} E_{\mu_{\mathbf{x}'}}[\Delta \mathbf{f}_{\mathbf{x}'}(\mathbf{y}')]_{}}$$

nodes $\Rightarrow \sum_{i, y_i} \sum_{k, y'_k} \mu_{\mathbf{x}}(y_i) \mu_{\mathbf{x}'}(y'_k) \Delta \mathbf{f}_{\mathbf{x}}(y_i)^{\top} \Delta \mathbf{f}_{\mathbf{x}'}(y'_k) +$

edges $\Rightarrow \sum_{\substack{ij \\ y_i, y_j}} \sum_{\substack{km \\ y'_k, y'_m}} \mu_{\mathbf{x}}(y_i, y_j) \mu_{\mathbf{x}'}(y'_k, y'_m) \Delta \mathbf{f}_{\mathbf{x}}(y_i, y_j)^{\top} \Delta \mathbf{f}_{\mathbf{x}'}(y'_k, y'_m)$

$\phi(x_i, y_i)$

$\phi(y_i, y_{i+1})$

■ Kernel trick works!

- Node and edge potentials can use kernels

Generalization Bound

Theorem:

Per-label loss \mathcal{L} for m training examples:

$$\underbrace{E_{\mathbf{x}} \mathcal{L}(\mathbf{w}, \mathbf{x})}_{\text{Test set per-label error}} \leq \underbrace{E_S \mathcal{L}^\gamma(\mathbf{w}, \mathbf{x})}_{\text{Training set per-label } \gamma\text{-error}} + \sqrt{\frac{K}{m} \left[\frac{\|\Delta \mathbf{f}\|^2 \|\mathbf{w}\|^2}{\gamma^2} [\ln m + \ln L] + \ln \frac{1}{\delta} \right]}$$

better as margin increases

with probability at least $1-\delta$.

- Distribution-free
- First per-label bound
- Dependence on L **logarithmic** vs. linear [Collins 01]
 - L = number of nodes and edges

Handwriting Recognition

Length: ~8 chars
 Letter: 16x8 pixels
 10-fold Train/Test
 5000/50000 letters
 600/6000 words

Models:

Multiclass-SVM

CRFs

M³ nets

Named Entity Recognition

- Locate and classify named entities in sentences:
 - 4 categories: organization, person, location, misc.
 - e.g. "U.N. official Richard Butler heads for Baghdad".
- CoNLL 03 data set (200K words train, 50K words test)

$y_i = \text{org/per/loc/misc/none}$

$f(y_i, x) = [\dots,$
 $I(y_i=\text{org}, x_i=\text{"U.N."}),$
 $I(y_i=\text{per}, x_i=\text{capitalized}),$
 $I(y_i=\text{loc}, x_i=\text{known city}),$
 $\dots,]$

Hypertext Classification

- WebKB dataset

- Four CS department websites: 1300 pages/3500 links
- Classify each page: faculty, course, student, project, other
- Train on three universities/test on fourth

loopy belief propagation

M³Ns

Basic algorithm works for any low tree-width graphical model

Learning to optimize

- Given poly-time optimization problem
 - Minimum spanning tree
 - Bipartite matching
 - Shortest path
 - ...
- Max-margin learning optimization criterion
 - Weights of Markov network
 - Clustering distance function
 - Edge weights
 - ...

Conclusion

- Combine strengths of kernels and graphical models
 - Incorporate high-dim features
 - Exploit correlations and structure
- Efficient representation and learning procedure
 - Exact for triangulated networks (low-treewidth)
 - Approximate for untriangulated networks
 - Efficient SMO-like solver using network inference
- Generalization guarantees
 - Per-label bound
- Outperforms standard methods
 - OCR, Information Extraction and Hypertext Classification
