

Bruemmer

The authors describe a semantically tagged “3-d” visualization of both 3D and 2D content. The results are built around a specific experiment at the local Science Center. I want you to critique the experiment. What is wrong with this experimental setup- how would you propose doing the experiment / setup differently? Be creative.

Ricks

What do the authors mean when they say that they *quicken* information presented to the user?

Quickening seems apt for teleoperation in spatial circumstances (so I would argue); can you think of any other non-teleoperation circumstances when quickening would be useful for HRI, or is it of limited use?
