

# Homework on Bias & Class Project

---

- In the context of your final project:
  - What biases may be present in your model/data?
  - How might you discover those biases?
  - What is the worst scenario for how your ML system behaves if the biases aren't addressed? (What could happen to a vulnerable individual?)
  - What bias mitigation tactics might be available?
- What are your thoughts on data biases in general? What valuable lessons did you learn from the guest lecture presented on Monday (4/15)? Please share your thoughts with us. (A paragraph should suffice.)
