

# Physics of the roller-coaster

(1)

- Mass point moving on the spline

$v$  - tangential direction of the curve

$h_{max}$  - reached when  $|v| = \phi$

$h$  - the current vertical coordinate

Conservation of energy:

$$W_{kin} + W_{pot} = \text{const} = mgh_{max}$$

$$W_{kin} = \frac{1}{2}mv^2 \Rightarrow \text{energy of motion}$$

$$W_{pot} = mgh \Rightarrow \text{energy of position}$$

$$\frac{1}{2}mv^2 + mgh = mgh_{max}$$

$$v^2 = \frac{mgh_{max} - mgh}{\frac{1}{2}m} \Rightarrow |v| = \sqrt{2g(h_{max} - h)}$$

- given height  $h \Rightarrow$  we can compute  $|v|$

## Inverse problem

(3)

- given arclength  $s$ , determine parameter  $u$
- because  $s = s(u)$  is monotonically increasing func  
so is its inverse
- There is no exact formula for inverse
- use Bisection method

Bisection ( $u_{min}, u_{max}, s$ )

forver

{

$$u = \frac{u_{min} + u_{max}}{2}$$

if  $|s(u) - s| < \text{epsilon}$

Return  $u$ ;

if  $s(u) > s$

$$u_{max} = u$$

else

$$u_{min} = u$$

}

$S(u)$  = the length of the curve from start to  $P(u)$

$$S(u) = \int_0^u \sqrt{x'(u)^2 + y'(u)^2} du$$

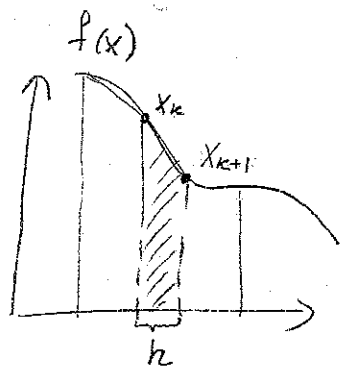

- can not evaluate this integral analytically
- Have to evaluate numerically

Numerical Integration:

$$\int_a^b f(x) dx = \sum_{k=1}^{(n-1)} \frac{h}{2} (f(x_k) + f(x_{k+1})) + O(h^3)$$

Trapezoidal rule

$n$  = corresponds to the number of intervals

$$\int_a^b f(x) dx = \sum_{k=1}^{(n-1)/2} \frac{h}{3} [f(x_{2k-1}) + 4f(x_{2k}) + f(x_{2k+1})] + O(h^5)$$

$n > 3$ ,  $n$  must be odd
