FORMAL LANGUAGES, AUTOMATA AND COMPUTABILITY

NON-DETERMINISM and REGULAR OPERATIONS

THURSDAY JAN 16

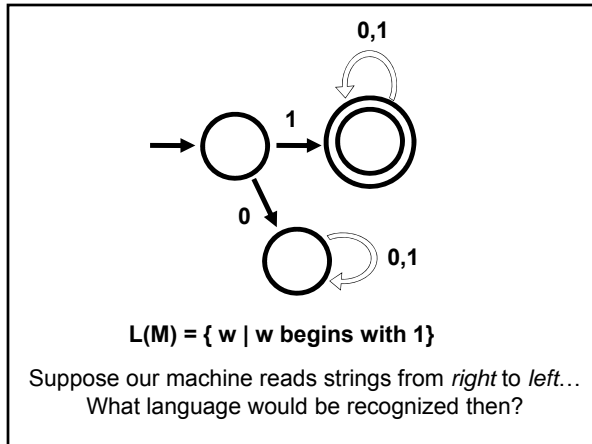

UNION THEOREM
The union of two regular languages
is also a regular language
“Regular Languages Are Closed Under Union”

INTERSECTION THEOREM
The intersection of two regular
languages is also a regular language

Complement THEOREM
The complement of a regular
language is also a regular language

In other words,
if L is regular then so is $\neg L$,
where $\neg L = \{ w \in \Sigma^* \mid w \notin L \}$

Proof ?

$L(M) = \{ w \mid w \text{ ends with } 1 \}$
Is $L(M)$ regular?

THE REVERSE OF A LANGUAGE

Reverse: $L^R = \{ w_k \dots w_1 \mid w_k \dots w_1 \in L, w_i \in \Sigma \}$

If L is recognized by a normal DFA,
Then L^R is recognized by a DFA reading from right to left!

Can every "Right-to-Left DFA" be replaced
by a normal DFA??

REVERSE THEOREM

The reverse of a regular language is
also a regular language

"Regular Languages Are Closed Under Reverse"

If a language can be recognized by a DFA
that reads strings from *right to left*,
then there is a "normal" DFA that accepts
the same language

REVERSING DFAs

Assume L is a regular language.
Let M be a DFA that recognizes L

Task: Build a DFA M^R that accepts L^R

If M accepts w, then w describes a
directed path in M from *start* to an *accept*
state.

First Attempt:

Try to define M^R as M with the arrows reversed.
Turn start state into a final state.
Turn final states into start states.

M^R IS NOT ALWAYS A DFA!

It could have many start states

Some states may have too many outgoing
edges,
or none at all!

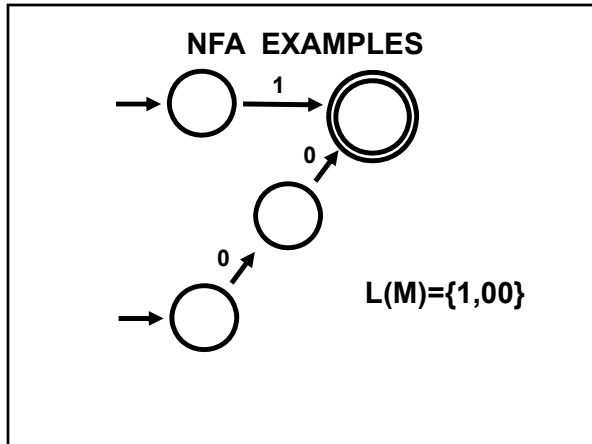

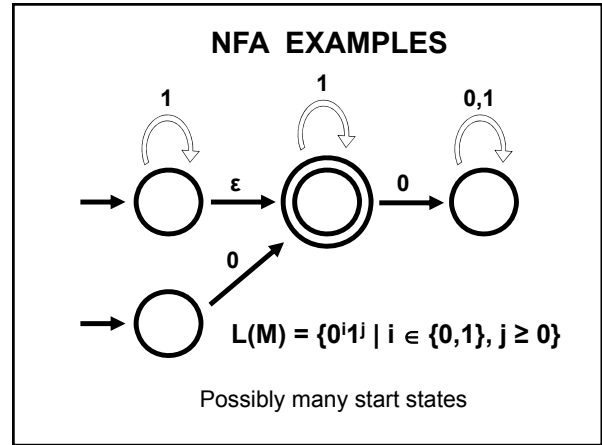

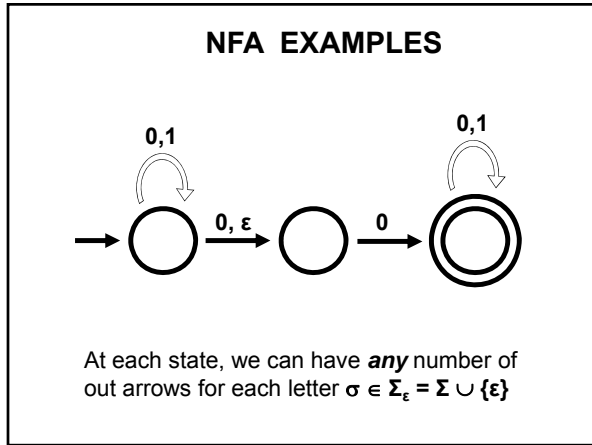

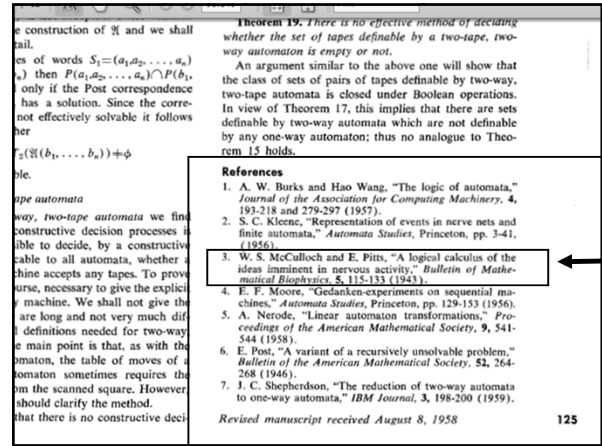

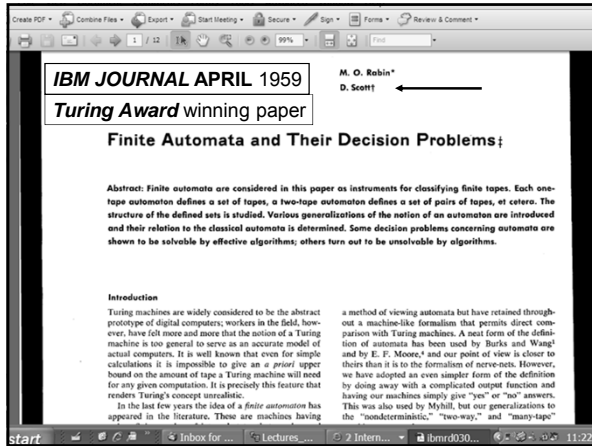

NONDETERMINISM

What happens with 100?

We will say that this machine accepts a string if
there is *some path* that reaches an accept state
from a start state.

A **non-deterministic** finite automaton (NFA) is a 5-tuple $N = (Q, \Sigma, \delta, Q_0, F)$

- Q is the set of states
- Σ is the alphabet
- $\delta : Q \times \Sigma_\epsilon \rightarrow 2^Q$ is the transition function
- $Q_0 \subseteq Q$ is the set of start states
- $F \subseteq Q$ is the set of accept states

2^Q is the set of all possible subsets of Q
 $\Sigma_\epsilon = \Sigma \cup \{\epsilon\}$

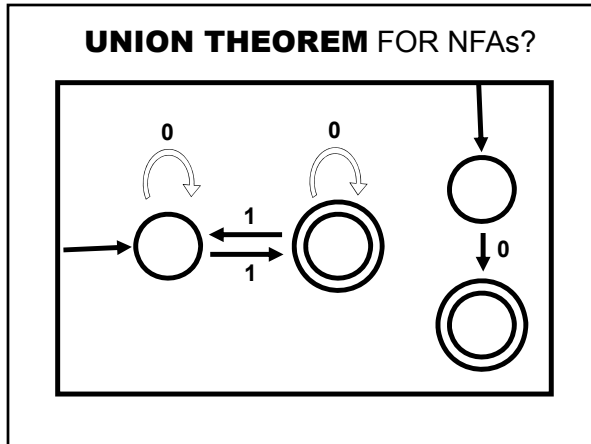

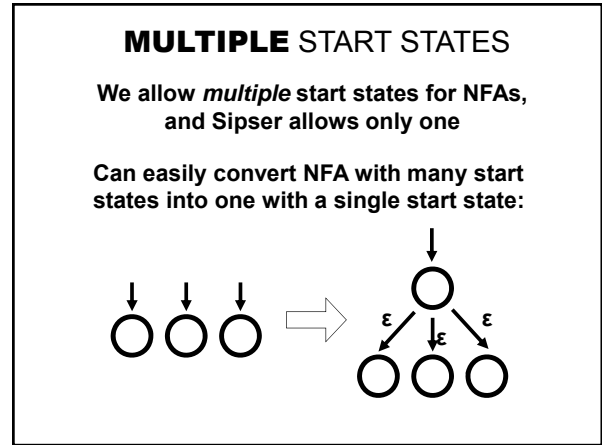

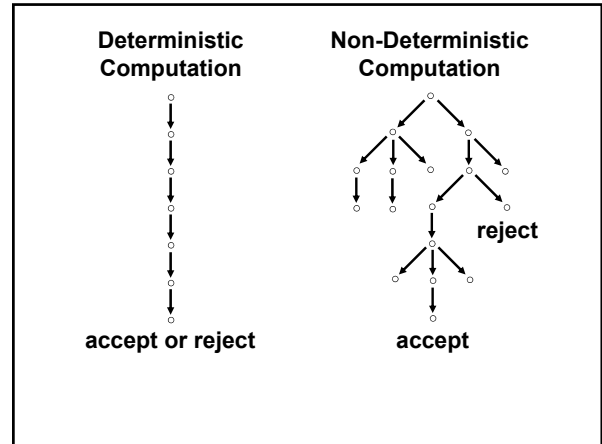

Let $w \in \Sigma^*$ and suppose w can be written as $w_1 \dots w_n$ where $w_i \in \Sigma_\epsilon$ (ϵ = empty string)

Then N accepts w if there are $r_0, r_1, \dots, r_n \in Q$ such that

- $r_0 \in Q_0$
- $r_{i+1} \in \delta(r_i, w_{i+1})$ for $i = 0, \dots, n-1$, and
- $r_n \in F$

$L(N)$ = the language recognized by N
= set of all strings machine N accepts

A language L is recognized by an NFA N if $L = L(N)$.

NFAs ARE SIMPLER THAN DFAs

An NFA that recognizes the language {1}:

NFAs ARE SIMPLER THAN DFAs

An DFA that recognizes the language {1}:

BUT DFAs CAN **SIMULATE** NFAs!

Theorem: Every NFA has an equivalent* DFA

Corollary: A language is regular iff it is recognized by an NFA

Corollary: L is regular iff L^R is regular

* N is equivalent to M if L(N) = L(M)

FROM NFA TO DFA

Input: NFA N = (Q, Σ, δ, Q₀, F)

Output: DFA M = (Q', Σ, δ', q₀', F')

To learn if NFA accepts, we could do the computation in parallel, maintaining the set of all possible states that can be reached

Idea:
 $Q' = 2^Q$

FROM NFA TO DFA

Input: NFA N = (Q, Σ, δ, Q₀, F)

Output: DFA M = (Q', Σ, δ', q₀', F')

$$Q' = 2^Q$$

$$\delta' : Q' \times \Sigma \rightarrow Q'$$

$$\delta'(R, \sigma) = \bigcup_{r \in R} \epsilon(\delta(r, \sigma)) \quad *$$

$$q_0' = \epsilon(Q_0)$$

$$F' = \{ R \in Q' \mid f \in R \text{ for some } f \in F \}$$

*

For $R \subseteq Q$, the ϵ -closure of R, $\epsilon(R) = \{q \text{ that can be reached from some } r \in R \text{ by traveling along zero or more } \epsilon \text{ arrows}\}$

EXAMPLE OF ϵ -CLOSURE

$$\epsilon(\{q_0\}) =$$

$$\epsilon(\{q_1\}) =$$

$$\epsilon(\{q_2\}) =$$

Given: NFA $N = (\{1,2,3\}, \{a,b\}, \delta, \{1\}, \{1\})$
 Construct: Equivalent DFA M
 $M = (2^{\{1,2,3\}}, \{a,b\}, \delta', \{1,3\}, \{\{1\}, \dots\})$

$\epsilon(\{1\}) = \{1,3\}$

NFAs CAN MAKE PROOFS MUCH EASIER!

Remember this on your Homework!

REGULAR LANGUAGES CLOSED UNDER CONCATENATION
 Concatenation: $A \cdot B = \{vw \mid v \in A \text{ and } w \in B\}$
 Given DFAs M_1 and M_2 , connect accept states in M_1 to start states in M_2

$L(N) = L(M_1) \cdot L(M_2)$

REGULAR LANGUAGES CLOSED UNDER CONCATENATION
 Concatenation: $A \cdot B = \{vw \mid v \in A \text{ and } w \in B\}$
 Given DFAs M_1 and M_2 , connect accept states in M_1 to start states in M_2

$L(N) = L(M_1) \cdot L(M_2)$

RLs ARE CLOSED UNDER STAR
 Star: $A^* = \{s_1 \dots s_k \mid k \geq 0 \text{ and each } s_i \in A\}$
 Let M be a DFA, and let $L = L(M)$
 Can construct an NFA N that recognizes L^*

Formally:

Input: $M = (Q, \Sigma, \delta, q_1, F)$
 Output: $N = (Q', \Sigma, \delta', \{q_0\}, F')$

$Q' = Q \cup \{q_0\}$
 $F' = F \cup \{q_0\}$

$$\delta'(q,a) = \begin{cases} \{\delta(q,a)\} & \text{if } q \in Q \text{ and } a \neq \epsilon \\ \{q_1\} & \text{if } q \in F \text{ and } a = \epsilon \\ \{q_1\} & \text{if } q = q_0 \text{ and } a = \epsilon \\ \emptyset & \text{if } q = q_0 \text{ and } a \neq \epsilon \\ \emptyset & \text{else} \end{cases}$$

1. $L(N) \subseteq L^*$

Assume $w = w_1 \dots w_k$ is in L^* , where $w_1, \dots, w_k \in L$

We show N accepts w by induction on k

Base Cases:

- ✓ $k = 0$ ($w = \epsilon$)
- ✓ $k = 1$ ($w \in L$)

Inductive Step:

Assume N accepts all strings $v = v_1 \dots v_k \in L^*$, $v_i \in L$ and let $u = u_1 \dots u_k u_{k+1} \in L^*$, $u_j \in L$

Since N accepts $u_1 \dots u_k$ (by induction) and M accepts u_{k+1} , N must accept u

2. $L(N) \subseteq L^*$

Assume w is accepted by N , we show $w \in L^*$

If $w = \epsilon$, then $w \in L^*$

If $w \neq \epsilon$, write w as $w=uv$, where v is the substring read after the *last* ϵ -transition

REGULAR LANGUAGES ARE CLOSED UNDER THE REGULAR OPERATIONS

- Union: $A \cup B = \{ w \mid w \in A \text{ or } w \in B \}$
- Intersection: $A \cap B = \{ w \mid w \in A \text{ and } w \in B \}$
- Negation: $\neg A = \{ w \in \Sigma^* \mid w \notin A \}$
- Reverse: $A^R = \{ w_1 \dots w_k \mid w_k \dots w_1 \in A \}$
- Concatenation: $A \cdot B = \{ vw \mid v \in A \text{ and } w \in B \}$
- Star: $A^* = \{ w_1 \dots w_k \mid k \geq 0 \text{ and each } w_i \in A \}$

SOME LANGUAGES **ARE NOT** REGULAR

$B = \{0^n 1^n \mid n \geq 0\}$ is NOT regular!

WHICH OF THESE ARE REGULAR

$C = \{ w \mid w \text{ has equal number of occurrences of } 01 \text{ and } 10 \}$

$D = \{ w \mid w \text{ has equal number of } 1\text{s and } 0\text{s} \}$
