

15-122: Principles of Imperative Computation

Course Syllabus

Fall 2014

Tom Cortina and Robert Simmons

September 27, 2014

This course teaches imperative programming and methods for ensuring the correctness of programs. It is intended for students with a basic understanding of programming (variables, expressions, loops, arrays, functions). Students will learn the process and concepts needed to go from high-level descriptions of algorithms to correct imperative implementations, with specific application to basic data structures and algorithms. Much of the course will be conducted in a subset of C amenable to verification, with a transition to full C near the end.

Either 21-127 *Concepts of Mathematics* or 15-151 *Mathematical Foundations for Computer Science* is a co-requisite (must be taken before or in the same semester). This course is a prerequisite for 15-213 *Computer Systems* and 15-210 *Parallel and Sequential Data Structures and Algorithms*.

1 Course Objectives

We categorize learning outcomes into *computational thinking*, *programming skills* and *data structures and algorithms*.

Computational Thinking: Students should leave this course able to explain abstraction and other key computer science concepts, apply these fundamental concepts as problem-solving tools, and wield *contracts* as a tool for reasoning about the safety and correctness of programs.¹

¹The importance of *computational thinking* as a fundamental skill has been discussed by Jeannette Wing (<http://www.cs.cmu.edu/afs/cs/usr/wing/www/publications/Wing06.pdf>) and by the Computer Science Teachers Association (<http://www.iste.org/docs/ct-documents/computational-thinking-operational-definition-flyer.pdf>).

Programming Skills: Students should leave this course able to read and write code for imperative algorithms and data structures.

Algorithms and Data Structures: Students should leave this course able to describe the implementation of a number of basic algorithms and data structures, effectively employ those algorithms and data structures, and explain and interpret worst-case asymptotic complexity arguments.

2 Resources

Lecture notes: There is no textbook for this course; lecture notes and other resources will be provided through the “Schedule” page of the course website. We do not expect students to read lecture notes before lecture, but students interested in reading ahead can look at a previous instance of the course: [Summer 2014](#), [Spring 2014](#), [Spring 2013](#), [Fall 2012](#), [Summer 2012](#), [Spring 2012](#), [Summer 2011](#), [Spring 2011](#), or [Fall 2010](#).

Online resources: All course resources will all be linked from the course home page.

- Home page (<https://whiteboard.ddt.cs.cmu.edu/#/15122-f13>)
Schedule, office hours, lecture notes, written homework hand-in.
- Autolab (<https://autolab.cs.cmu.edu/15122-f13>)
Grades, programming homework hand-in, style comments.
- Piazza (<https://piazza.com/cmu/fall2013/15122>)
Announcements, discussions, questions.
- Quizzes (<https://pic.cs.cmu.edu/quiz/>)
Weekly quizzes between 10am and 10pm Friday.

Archived exams: Midterms and final exams from previous semesters, as well as sample solutions, will be posted before each exam.

Programming tools: In weeks 1–10 the course uses C0, a small safe subset of C augmented with a layer to express *contracts*. A tutorial for this language is available online at <http://c0.typesafety.net/tutorial/>. This language has been specifically designed to support the student learning objectives in this course. In particular it provides garbage collection (freeing students from dealing with low-level details of explicit memory management), fixed range modular integer arithmetic (avoiding complexities of floating point arithmetic and multiple data sizes), an unambiguous language definition (guarding against relying on undefined behavior), and contracts (making code expectations explicit and localize reasoning).

In weeks 10–15 course transitions to C, in preparation for subsequent systems courses. Emphasis is on transferring positive habits developed in the use of C0, and on practical advice for avoiding the pitfalls and understanding the idiosyncrasies of C. We use the `valgrind` tool to test proper memory management.

3 Student Evaluation

The course is graded on a 1000-point scale.

- Homework (400 points)
 - 8 smaller programming assignments
 - 2 larger programming projects
 - 12-13 written assignments
- 1 Final (250 points), date TBA
- 2 Midterms (125 points each), in class October 2 and November 6
- 11 Quizzes (10 points each, 3 lowest scores dropped)
- 13 Labs (2 points for attendance and participation each, 20 points max)

3.1 Final grades

A total score of 900 and above is guaranteed an A, 800 and above a B, 700 and above a C, and 600 and above a D. Grade cutoffs may be lowered based on the difficulty of exams and assignments. Precise grade cutoffs will not be discussed at any point during or after the semester.

For students very close to grade boundaries, instructors may, at their discretion, consider participation in lecture and recitation, extra credit and bonus assignments, and exam performance when assigning the final grade.

3.2 Deadlines

There will generally be there will be three deadlines every week:

- 6pm Monday - Written homework due (in lab or outside of Tom Cortina's office, GHC 4117).
- 10pm Thursday - Programming homework due (via Autolab).
- 10am-10pm Friday - Quiz must be taken online during some 30-minute period.

4 Policies

4.1 Class presence and participation

Active participation by you and other students will ensure that everyone has the best learning experience in this class. We may take participation in lecture and recitation (the one you are *registered* for) into account when setting final grades, and we will explicitly give a small number of points for attendance and participation in Monday labs. Therefore, please attend the lecture, lab, and recitation you are registered for. Requests for lecture or recitation changes will be handled by Tom Cortina.

4.2 Laptops and mobile devices

As research on learning shows, unexpected noises and movement automatically divert and capture people's attention, which means you are affecting everyone's learning experience if your cell phone, pager, laptop, etc. makes noise or is visually distracting during class.

Therefore, please silence all mobile devices during class. You are welcome to use laptops for note-taking, but if you are able, please do so from the back of the classroom. If you are not in the back of the classroom, do not use your laptop for anything besides note-taking. Do not work on assignments for this or any other class while attending lecture or recitation.

4.3 Programming style

Students are expected to write code with good programming style; a review of what constitutes good style is given at <http://www.cs.cmu.edu/~rjsimmon/15122-f13/misc/styleguide.pdf>.

For a small subset of assignments (likely 2 or 3), TAs will review all final submissions by hand. If there are significant style issues, they may give a non-passing “redo” grade on style. Students who are told to redo their style *must* address these issues and discuss their revisions with a TA in a timely fashion or they will not receive credit for the programming assignment!

The autograder for C0 assignments will use the `-w` flag to `cc0` which gives style warnings. Students with style warnings may be graded for style and given a “redo” grade on any assignment.

4.4 Late work

We want to make sure that you can get good feedback, and we are always willing to give feedback on any work that you want to hand in. Nevertheless, we have somewhat strict penalties for late work because it is not in anyone’s interest for individuals to fall behind our schedule.

- *Programming*: each student has four grace days, *at most one of which* can be used on any of the 10 programming assignments to extend the deadline by 24 hours to 10pm on Friday (assuming a Thursday 10pm deadline). Late submissions from students who have exhausted their late days will receive only marginal credit, and no work will be accepted more than 24 hours after the original deadline.
- *Written*: Unexcused late written homework will usually be accepted for a moderate (20%-50%) late penalty, but only if arranged in advance with an instructor.
- *Quizzes*: Each quiz can, in fact, be taken until 10am on Saturday without penalty. After that, the quiz cannot be taken late because solutions will be released.

4.5 Personal accommodations

Reasonable exceptions to the late work policy may be made for family, religious, athletic, or other external obligations *if* we know about them well in advance (at least one week, assuming circumstances make this possible). If

you have other extenuating circumstances, such as an extended illness that affects your ability to complete the course, please notify the instructors.

We do not currently have the ability to allow people to take the quiz late. If anyone misses more than three quizzes for a valid reason, we will take this into account when assigning final grades.

Students with disabilities: If you wish to request an accommodation due to a documented disability, please inform your instructor and contact Disability Resources as soon as possible (access@andrew.cmu.edu). Special accommodation for exams will be coordinated by Robert Simmons, and must be requested for *each* exam separately a week in advance. Double time on quizzes can be requested all at once. Other requests for deadline flexibility will be handled on a case-by-case basis.

Academic integrity: The university policies and procedures on academic integrity will be applied rigorously; all students are required to fill out the form at <http://www.cs.cmu.edu/~rjsimmon/15122-f13/misc/acad.pdf> indicating that they understand and accept this policy.

The value of your degree depends on the academic integrity of yourself and your peers in each of your classes. It is expected that, unless otherwise instructed, the work you submit as your own will be your own work and not someone else's work or a collaboration between yourself and other(s).

Please read the [University Policy on Academic Integrity](#) carefully to understand the penalties associated with academic dishonesty at Carnegie Mellon. In this class, cheating/copying/plagiarism means copying all or part of a program or homework solution from another student or unauthorized source such as the Internet, knowingly giving such information to another student, or giving or receiving unauthorized information during an examination. In general, *each solution you submit (quiz, written assignment, programming assignment, midterm or final exam) must be your own work*. In the event that you use information written by another person in your solution, you must cite the source of this information (and receive prior permission if unsure whether this is permitted). It is considered cheating to compare complete or partial answers, discuss details of solutions, or sit near another person who is taking the same course and try to complete the assignment together.

Your course instructor reserves the right to determine an appropriate penalty based on the violation of academic dishonesty that occurs. *Violations of the university policy are likely to result in severe penalties including failing*

this course and possible expulsion from Carnegie Mellon University. If you have any questions about this policy and any work you are doing in the course, please feel free to contact your instructor for help.

We will be using the Moss system to detect software plagiarism.

It is not considered cheating to clarify vague points in the assignments, lectures, lecture notes, or to give help or receive help in using the computer systems, compilers, debuggers, profilers, or other facilities. It is not cheating to review graded assignments or exams with students in the same class as you, but it *is* considered unauthorized assistance to share these materials between different iterations of the course.
