## L-17 Multicast Reliability and Congestion Control

## Multicast Issues

- Reliable transfer
- Congestion control
- Assigned reading
  - [F+97] A Reliable Multicast Framework for High-Weight Sessions and Application Level Framing
  - [MJV96] Receiver-driven Layered Multicast

## Overview

- **Reliability**
  - Scalable Reliable Multicast
  - Reliable Multicast Transport Protocol
  - Lightweight Multicast Service
- Receiver-driven Layered Multicast
- Other Issues

## Loss Recovery

- **Sender-reliable**
  - Wait for ACKs from all receivers. Re-send on timeout or selective ACK
  - Per receiver state in sender not scalable
  - ACK implosion
- **Receiver-reliable**
  - Receiver NACKs (resend request) lost packet
  - Does not provide 100% reliability
  - NACK implosion

## Implosion

Packet 1 is lost

All 4 receivers request a resend

## Retransmission

- **Re-transmitter**
  - Options: sender, other receivers
- **How to retransmit**
  - Unicast, multicast, scoped multicast, retransmission group, ...
- **Problem: Exposure**

## Exposure

Packet 1 does not reach R1; Receiver 1 requests a resend

Packet 1 resent to all 4 receivers

The diagram illustrates a network topology with a source S and four receivers R1, R2, R3, and R4. In the first state, packet 1 is sent from S to R1 but is lost, indicated by a red 'X' on the link. R1 sends a 'Resend request' (labeled '1 2'). In the second state, the source S resends packet 1, which is then received by all four receivers (R1, R2, R3, and R4), labeled 'Resent packet'.

© Srinivasan Seshan, 2001 L-15.3-7-01 7

## Ideal Recovery Model

Packet 1 reaches R1 but is lost before reaching other Receivers

Only one receiver sends NACK to the nearest S or R with packet

The diagram shows a network topology where packet 1 reaches R1 but is lost on the link to the next router. R1 sends a 'Resend request' (labeled '1 2'). The source S then resends packet 1, which is only received by R1 and R2, labeled 'Resend packet'. A note states: 'Repair sent only to those that need packet'.

© Srinivasan Seshan, 2001 L-15.3-7-01 8

## Aside: Using the Routers

The diagram shows a network topology where packet 1 is lost at R1. R1 sends a 'NACK' to the source S. The source S then resends packet 1, which is received by R1 and R2. A note indicates 'RTX' (retransmission) at R1.

- Routers do transport level processing:
  - Buffer packets
  - Combine ACKs
  - Send retransmissions
- Model solves implosion and exposure, but not scalable
- Violates end-to-end argument

© Srinivasan Seshan, 2001 L-15.3-7-01 9

## Overview

- Reliability
  - Scalable Reliable Multicast
  - Reliable Multicast Transport Protocol
  - Lightweight Multicast Service
- Receiver-driven Layered Multicast
- Other Issues

© Srinivasan Seshan, 2001 L-15.3-7-01 10

## SRM

- Originally designed for  $wb$
- Receiver-reliable
  - NACK-based
- Every member may multicast NACK or retransmission

© Srinivasan Seshan, 2001 L-15.3-7-01 11

## SRM Request Suppression

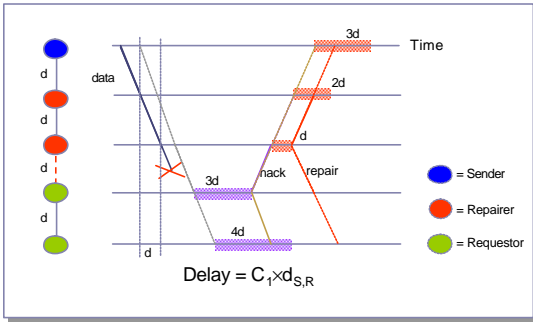

Packet 1 is lost; R1 requests to resend and Receivers

Packet 1 is resent; R2 and R3 no longer have to request a resend

The diagram shows a network topology where packet 1 is lost at R1. R1 sends a 'Resend request' (labeled '1 2'). The source S then resends packet 1, which is received by R1, R2, and R3. A note states: 'Delay varies by distance'. R2 and R3 do not send a resend request because they have already received the packet.

© Srinivasan Seshan, 2001 L-15.3-7-01 12

## Deterministic Suppression

© Srinivasan Seshan, 2001

L-15.3-7-01

13

## SRM Star Topology

Packet 1 is lost; All Receivers request resends

Packet 1 is resent to all Receivers

© Srinivasan Seshan, 2001

L-15.3-7-01

14

## SRM: Stochastic Suppression

© Srinivasan Seshan, 2001

L-15.3-7-01

15

## SRM (Summary)

- NACK/Retransmission suppression
  - Delay before sending
  - Delay based on RTT estimation
  - Deterministic + Stochastic components
- Periodic session messages
  - Full reliability
  - Estimation of distance matrix among members

© Srinivasan Seshan, 2001

L-15.3-7-01

16

## What's Missing?

- Losses at link (A,C) causes retransmission to the whole group
- Only retransmit to those members who lost the packet
- [Only request from the nearest responder]

© Srinivasan Seshan, 2001

L-15.3-7-01

17

## Local Recovery

- Application-level hierarchy
  - Fixed v.s. dynamic
- TTL scoped multicast
- Router supported

© Srinivasan Seshan, 2001

L-15.3-7-01

18

## Overview

- Reliability
  - Scalable Reliable Multicast
  - **Reliable Multicast Transport Protocol**
  - Lightweight Multicast Service
- Receiver-driven Layered Multicast
- Other Issues

© Srinivasan Seshan, 2001

L-15.3-7-01

19

## RMTP

- Reliable Multicast Transport Protocol by Purdue and AT&T Research Labs
- Designed for file dissemination (single-sender)
- Deployed in AT&T's billing network

© Srinivasan Seshan, 2001

L-15.3-7-01

20

## RMTP: Fixed Hierarchy

- Rcvr unicasts periodic ACK to its Designated Receiver (DR)
- DR unicasts its own ACK to its parent
- Rcvr chooses closest statically configured (DR)
- Mcast or unicast retransmission
  - Based on percentage of requests
  - Scoped mcast for local recovery

© Srinivasan Seshan, 2001

L-15.3-7-01

21

## RMTP: Comments

- +: Heterogeneity
  - Lossy link or slow receiver will only affect a local region
- -: Position of DR critical
  - Static hierarchy cannot adapt local recovery zone to loss points

© Srinivasan Seshan, 2001

L-15.3-7-01

22

## Overview

- Pragmatic General Multicast

© Srinivasan Seshan, 2001

L-15.3-7-01

23

## Pragmatic General Multicast

- Cisco's reliable multicast protocol
- NACK-based, with suppression
- Repair only forwarded to the NACKers

© Srinivasan Seshan, 2001

L-15.3-7-01

24

## Pragmatic General Multicast

Packet 1 reaches only R1; R2, R3, R4 request resends

Routers remember resend requests

Packet 1 resent to R2, R3, R4; Not resent to R1

© Srinivasan Seshan, 2001 L-15.3-7-01 25

## Overview

- Reliability
  - Scalable Reliable Multicast
  - Reliable Multicast Transport Protocol
  - Lightweight Multicast Service
- Receiver-driven Layered Multicast
- Other Issues

© Srinivasan Seshan, 2001 L-15.3-7-01 26

## Light-weight Multicast Service (LMS)

- Enhance multicast routing with selective forwarding
- LMS extends router forwarding - what routers are meant to do in the first place
- No packet storing or processing at routers
- Strictly IP: no peeking into higher layers

© Srinivasan Seshan, 2001 L-15.3-7-01 27

## The LMS Concept

Heavy-weight model      LMS: Receiver acts as surrogate

- Router stores packets, receives NACKs and sends retransmissions
- Router chooses a receiver as a surrogate
- Router steers all control messages to surrogate
- Router relays messages from surrogate to the subtree

© Srinivasan Seshan, 2001 L-15.3-7-01 28

## LMS: Definitions

- Replier
  - Receiver volunteered to answer requests
- Turning point
  - Where requests start to move downstream
- Directed mcast
- Mcast to a subtree

© Srinivasan Seshan, 2001 L-15.3-7-01 29

## LMS with Replier Links

Packet 1 reaches only R1; R2 requests resend

Resend requests from each receiver follow replier links

© Srinivasan Seshan, 2001 L-15.3-7-01 30

## LMS with Replier Links

Request from replier links go up towards the Source

Packet 1 is resent to all Receivers

© Srinivasan Seshan, 2001 L-15.3-7-01 31

## LMS: Comments

- Replier problems
  - Selection? Fault tolerance?
- Works with unidirectional shared trees (PIM)
  - Needs to relay requests from core/RP to sender
- Difficulties with bi-directional shared trees
  - Needs per-source state

© Srinivasan Seshan, 2001 L-15.3-7-01 32

## Overview

- Reliability
  - Scalable Reliable Multicast
  - Reliable Multicast Transport Protocol
  - Lightweight Multicast Service
- Receiver-driven Layered Multicast
- Other Issues

© Srinivasan Seshan, 2001 L-15.3-7-01 33

## Multicast Congestion Control

- What if receivers have very different bandwidths?
- Send at max?
- Send at min?
- Send at avg?

© Srinivasan Seshan, 2001 L-15.3-7-01 34

## Video Adaptation: RLM

- Receiver-driven Layered Multicast
- Layered video encoding
- Each layer uses its own mcast group
- On spare capacity, receivers add a layer
- On congestion, receivers drop a layer
- Join experiments used for shared learning

© Srinivasan Seshan, 2001 L-15.3-7-01 35

## Layered Media Streams

R1 joins layer 1, joins layer 2, joins layer 3  
 R2 join layer 1, join layer 2, fails at layer 3  
 R3 joins layer 1, fails at layer 2

© Srinivasan Seshan, 2001 L-15.3-7-01 36

## Drop Policies for Layered Multicast

- Priority
  - Packets for low bandwidth layers are kept, drop queued packets for higher layers
  - Requires router support
- Uniform (e.g., drop tail, RED)
  - Packets arriving at congested router are dropped regardless of their layer
- Which is better?
  - Intuition vs. reality!

© Srinivasan Seshan, 2001

L-15.3-7-01

37

## RLM Intuition

- Uniform
  - Better incentives to well-behaved users
  - If oversend, performance rapidly degrades
  - Clearer congestion signal
  - Allows shared learning
- Priority
  - Can waste upstream resources
  - Hard to deploy
- RLM approaches optimal operating point
  - Uniform is already deployed

© Srinivasan Seshan, 2001

L-15.3-7-01

38

## RLM Intuition

© Srinivasan Seshan, 2001

L-15.3-7-01

39

## Receiver-Driven Layered Multicast

- Each layer a separate group
  - Receiver subscribes to max group that will get through with minimal drops
- Dynamically adapt to available capacity
  - Use packet losses as congestion signal
- Assume no special router support
  - Packets dropped independently of layer

© Srinivasan Seshan, 2001

L-15.3-7-01

40

## RLM Join Experiment

- Receivers periodically try subscribing to higher layer
- If enough capacity, no congestion, no drops
  - Keep layer (& try next layer)
- If not enough capacity, congestion, drops
  - Drop layer (& increase time to next retry)
- What about impact on other receivers?

© Srinivasan Seshan, 2001

L-15.3-7-01

41

## Join Experiments

© Srinivasan Seshan, 2001

L-15.3-7-01

42

## RLM Scalability?

- What happens with more receivers?
- Increased frequency of experiments?
  - More likely to conflict (false signals)
  - Network spends more time congested
- Reduce # of experiments per host?
  - Takes longer to converge

© Srinivasan Seshan, 2001

L-15.3-7.01

43

## RLM Receiver Coordination

- Receiver advertises intent to add layer
- Other receivers
  - Avoid conflicting experiments
  - If experiment fails, will see increased drops => don't try adding layer! (shared learning)
  - OK to try adding lower layer during higher layer experiment
    - Won't cause drops at higher layer!

© Srinivasan Seshan, 2001

L-15.3-7.01

44

## Overview

- Reliability
  - Scalable Reliable Multicast
  - Reliable Multicast Transport Protocol
  - Lightweight Multicast Service
- Receiver-driven Layered Multicast
- Other Issues

© Srinivasan Seshan, 2001

L-15.3-7.01

45

## Inferring Topology

- What if packet is lost on link?
  - All children of link will not get packet
- Idea: use loss "fingerprints" to identify siblings
  - Siblings will have the most similar fingerprints
- Various techniques to build tree from collection of fingerprints

© Srinivasan Seshan, 2001

L-15.3-7.01

46

## Session Messages

- SRM
  - Identify what node knows about global state
- Multimedia & other applications
  - Identify list of members
  - Communicate loss rates → possibly for congestion control or other feedback
  - What if it is a large group?
    - Periodic transmissions can flood network!!

© Srinivasan Seshan, 2001

L-15.3-7.01
