

UNIT 5C

Merge Sort

15110 Principles of Computing,
Carnegie Mellon University - CORTINA

1

Divide and Conquer

- In the military: strategy to gain or maintain power
- In computation:
 - Divide the problem into “simpler” versions of itself.
 - Conquer each problem using the same process (usually recursively).
 - Combine the results of the “simpler” versions to form your final solution.
- Examples: Towers of Hanoi, fractals, Binary Search, Merge Sort

15110 Principles of Computing,
Carnegie Mellon University - CORTINA

2

Merge Sort

- Required: Array A of n elements.
- Result: Returns a new array containing the same elements in non-decreasing order.
- General algorithm for merge sort:
 1. Sort the first half using merge sort. (recursive!)
 2. Sort the second half using merge sort. (recursive!)
 3. Merge the two sorted halves to obtain the final sorted array.

Divide (Split)

Conquer (Merge)

Example 1: Merge

array a	array b	array c
<u>0 1 2 3</u> 12 44 58 62	<u>0 1 2 3</u> 29 31 74 80	<u>0 1 2 3 4 5 6 7</u> 12
<u>0 1 2 3</u> 12 <u>44</u> 58 62	<u>0 1 2 3</u> 29 31 74 80	<u>0 1 2 3 4 5 6 7</u> 12 29
<u>0 1 2 3</u> 12 <u>44</u> 58 62	<u>0 1 2 3</u> 29 <u>31</u> 74 80	<u>0 1 2 3 4 5 6 7</u> 12 29 31
<u>0 1 2 3</u> 12 <u>44</u> 58 62	<u>0 1 2 3</u> 29 31 <u>74</u> 80	<u>0 1 2 3 4 5 6 7</u> 12 29 31 44

Example 1: Merge (cont'd)

array a	array b	array c
<u>0 1 2 3</u> 12 44 <u>58</u> 62	<u>0 1 2 3</u> 29 31 <u>74</u> 80	<u>0 1 2 3 4 5 6 7</u> 12 29 31 44 58
<u>0 1 2 3</u> 12 44 58 <u>62</u>	<u>0 1 2 3</u> 29 31 <u>74</u> 80	<u>0 1 2 3 4 5 6 7</u> 12 29 31 44 58 62
<u>0 1 2 3</u> 12 44 58 62	<u>0 1 2 3</u> 29 31 <u>74</u> 80	<u>0 1 2 3 4 5 6 7</u> 12 29 31 44 58 62 74 80

Example 2: Merge

array a	array b	array c
<u>0 1 2 3</u> <u>58</u> 67 74 90	<u>0 1 2 3</u> <u>19</u> 26 31 44	<u>0 1 2 3 4 5 6 7</u> 19
<u>0 1 2 3</u> <u>58</u> 67 74 90	<u>0 1 2 3</u> 19 <u>26</u> 31 44	<u>0 1 2 3 4 5 6 7</u> 19 26
<u>0 1 2 3</u> <u>58</u> 67 74 90	<u>0 1 2 3</u> 19 26 <u>31</u> 44	<u>0 1 2 3 4 5 6 7</u> 19 26 31
<u>0 1 2 3</u> <u>58</u> 67 74 90	<u>0 1 2 3</u> 19 26 31 <u>44</u>	<u>0 1 2 3 4 5 6 7</u> 19 26 31 44
<u>0 1 2 3</u> <u>58</u> 67 74 90	<u>0 1 2 3</u> 19 26 31 44	<u>0 1 2 3 4 5 6 7</u> 19 26 31 44 58 67 74 90

Merge

- Required: Two arrays a and b.
 - Each array must be sorted already in non-decreasing order.
- Result: Returns a new array containing the same elements merged together into a new array in non-decreasing order.
- We'll need two variables to keep track of where we are in arrays a and b: `index_a` and `index_b`.
 1. Set `index_a` equal to 0.
 2. Set `index_b` equal to 0.
 3. Create an empty array c.

Merge (cont'd)

4. While `index_a < the length of array a` and `index_b < the length of array b`, do the following:
 - a. If `a[index_a] ≤ b[index_b]`, then do the following:
 - i. append `a[index_a]` on to the end of array c
 - ii. add 1 to `index_a`
 - Otherwise, do the following:
 - i. append `b[index_b]` on to the end of array c
 - ii. add 1 to `index_b`

Merge (cont'd)

(Once we finish step 4, we've added all of the elements of either array a or array b to array c. The other array still has some elements left that need to be added to array c.)

5. If `index_a < the length of array a`, then:
 - append all remaining elements of array a on to the end of array c
- Otherwise:
 - append all remaining elements of array b on to the end of array c
6. Return array c as the result.

Merge in Ruby

```
def merge(a, b)
  index_a = 0
  index_b = 0
  c = []
  while index_a < a.length && index_b < b.length do
    if a[index_a] <= b[index_b] then
      c << a[index_a]
      index_a = index_a + 1
    else
      c << b[index_b]
      index_b = index_b + 1
    end
  end
end
```

Merge in Ruby (cont'd)

```
if (index_a < a.length) then
  for i in (index_a..a.length-1) do
    c << a[i]
  end
else
  for i in (index_b..b.length-1) do
    c << b[i]
  end
end
return c
end
```

Merge Sort: Base Case

- General algorithm for merge sort:
 1. Sort the first half using merge sort. (recursive!)
 2. Sort the second half using merge sort. (recursive!)
 3. Merge the two sorted halves to obtain the final sorted array.
- What is the base case?

If the list has only 1 element, it is already sorted so just return the list as the result.

Merge Sort: Halfway Point

- General algorithm for merge sort:
 1. Sort the first half using merge sort. (recursive!)
 2. Sort the second half using merge sort. (recursive!)
 3. Merge the two sorted halves to obtain the final sorted array.
- How do we determine the halfway point where we want to split the array *list*?

First half: `0..list.length/2-1`

Second half: `list.length/2..list.length-1`

Merge Sort in Ruby

```
def msort(list)
  return list if list.length == 1 # base case
  halfway = list.length/2
  list1 = list[0..halfway-1]
  list2 = list[halfway..list.length-1]
  newlist1 = msort(list1) # recursive!
  newlist2 = msort(list2) # recursive!
  newlist = merge(newlist1, newlist2)
  return newlist
end
```

Analyzing Efficiency

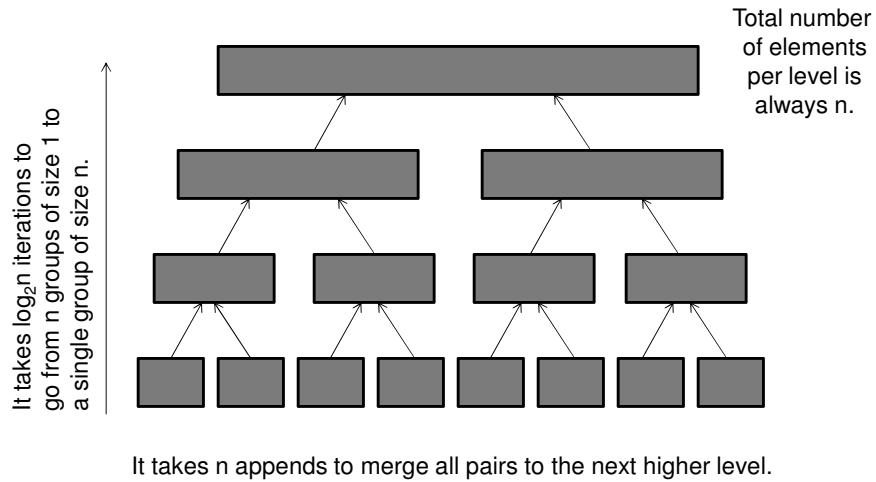

- If you merge two lists of size $i/2$ into one new list of size i , what is the maximum number of appends that you must do?
- Clearly, each element must be appended to the new list at some point, so the total number of appends is i .
- If you have a set of pairs of lists that need to be merged (two pairs at a time), and the total number of elements in all of the lists combined is n , the total number of appends will be n .

How many group merges?

- How many group merges does it take to go from n groups of size 1 to 1 group of size n ?
- Example: Merge sort on 32 elements.
 - Break down to groups of size 1 (base case).
 - Merge 32 lists of size 1 into 16 lists of size 2.
 - Merge 16 lists of size 2 into 8 lists of size 4.
 - Merge 8 lists of size 4 into 4 lists of size 8.
 - Merge 4 lists of size 8 into 2 lists of size 16.
 - Merge 2 lists of size 16 into 1 list of size 32.
- In general: $\log_2 n$ group merges must occur.

} $5 = \log_2 32$

Putting it all together

Big O

- In the worst case, merge sort requires $O(n \log n)$ time to sort an array with n elements.

Number of operations

$$n \log_2 n$$

$$4n \log_{10} n$$

$$n \log_2 n + 2n$$

Order of Complexity

$$O(n \log n)$$

$$O(n \log n)$$

$$O(n \log n)$$

O(N log N)

Computation, Carnegie
Mellon University -
CORTINA

21

Comparing Insertion Sort to Merge Sort

(Worst Case)

n	isort $(n(n+1)/2)$	msort $(n \log_2 n)$
8	36	24
16	136	64
32	528	160
2^{10}	524,800	10,240
2^{20}	549,756,338,176	20,971,520

For array sizes less than 100, there's not much difference between these sorts, but for larger array sizes, there is a clear advantage to merge sort.

15110 Principles of Computing,
Carnegie Mellon University - CORTINA

22

Sorting and Searching

- Recall that if we wanted to use binary search, the array must be sorted.
 - What if we sort the array first using merge sort?
 - Merge sort $O(n \log n)$ (worst case)
 - Binary search $O(\log n)$ (worst case)
 - Total time: $O(n \log n) + O(\log n) = O(n \log n)$ (worst case)

Comparing Big O Functions

Merge Sort: Iteratively

(optional)

- *If you are interested, the textbook discusses an iterative version of merge sort which you can read on your own.*
- *This version uses an alternate version of the `merge` function that is not shown in the textbook but is given in the `RubyLabs` gem.*
