Web Services

15-213 / 18-213: Introduction to Computer Systems
22nd Lecture, Nov. 15, 2011

Instructors:
Dave O’Hallaron, Greg Ganger, and Greg Kesden
Web History (seminal)

“Consider a future device for individual use, which is a sort of mechanized private file and library. It needs a name, and to coin one at random, "memex" will do. A memex is a device in which an individual stores all his books, records, and communications, and which is mechanized so that it may be consulted with exceeding speed and flexibility. It is an enlarged intimate supplement to his memory.”

1945:

- Vannevar Bush, “As we may think”, Atlantic Monthly, July, 1945
  - Describes the idea of a distributed hypertext system
  - A “memex” that mimics the “web of trails” in our minds
Web History

- **1989:**
  - Tim Berners-Lee (CERN) writes internal proposal to develop a distributed hypertext system
    - Connects “a web of notes with links”
    - Intended to help CERN physicists in large projects share and manage information

- **1990:**
  - Tim BL writes a graphical browser for Next machines
Web History (cont)

■ 1992
  ▪ NCSA server released
  ▪ 26 WWW servers worldwide

■ 1993
  ▪ Marc Andreessen releases first version of NCSA Mosaic browser
  ▪ Mosaic version released for (Windows, Mac, Unix)
  ▪ Web (port 80) traffic at 1% of NSFNET backbone traffic
  ▪ Over 200 WWW servers worldwide

■ 1994
  ▪ Andreessen and colleagues leave NCSA to form “Mosaic Communications Corp” (predecessor to Netscape)
How many of the $2^{32}$ IP addresses have registered domain names?
Web Servers

- Clients and servers communicate using the HyperText Transfer Protocol (HTTP)
  - Client and server establish TCP connection
  - Client requests content
  - Server responds with requested content
  - Client and server close connection (eventually)
- Current version is HTTP/1.1
  - RFC 2616, June, 1999.

http://www.w3.org/Protocols/rfc2616/rfc2616.html
Web Content

- Web servers return *content* to clients
  - *content*: a sequence of bytes with an associated MIME (Multipurpose Internet Mail Extensions) type

- Example MIME types
  - text/html: HTML document
  - text/plain: Unformatted text
  - application/postscript: Postscript document
  - image/gif: Binary image encoded in GIF format
  - image/jpeg: Binary image encoded in JPEG format
Static and Dynamic Content

- The content returned in HTTP responses can be either **static** or **dynamic**
  - **Static content**: content stored in files and retrieved in response to an HTTP request
    - Examples: HTML files, images, audio clips
    - Request identifies which content file
  - **Dynamic content**: content produced on-the-fly in response to an HTTP request
    - Example: content produced by a program executed by the server on behalf of the client
    - Request identifies which file containing executable code

- **Bottom line**: *(most) Web content is associated with a file that is managed by the server*
URLs and how clients and servers use them

- Unique name for a file: URL (Universal Resource Locator)
- Example URL: `http://www.cmu.edu:80/index.html`
- Clients use prefix (`http://www.cmu.edu:80`) to infer:
  - What kind (protocol) of server to contact (HTTP)
  - Where the server is (`www.cmu.edu`)
  - What port it is listening on (80)
- Servers use suffix (`/index.html`) to:
  - Determine if request is for static or dynamic content.
    - No hard and fast rules for this
    - Convention: executables reside in `cgi-bin` directory
  - Find file on file system
    - Initial “/” in suffix denotes home directory for requested content.
    - Minimal suffix is “/”, which server expands to configured default filename (usually, `index.html`)
Anatomy of an HTTP Transaction

```shell
unix> telnet www.cmu.edu 80
Trying 128.2.10.162...
Connected to www.cmu.edu.
Escape character is '^]'.
GET / HTTP/1.1
host: www.cmu.edu

HTTP/1.1 301 Moved Permanently
Location: http://www.cmu.edu/index.shtml

Connection closed by foreign host.
unix>
```

Client: open connection to server
Telnet prints 3 lines to the terminal

Client: request line
Client: required HTTP/1.1 HOST header
Client: empty line terminates headers.

Server: response line
Client should try again

Server: closes connection
Client: closes connection and terminates
Anatomy of an HTTP Transaction, Take 2

unix> telnet www.cmu.edu 80
Trying 128.2.10.162...
Connected to www.cmu.edu.
Escape character is '^[].
GET /index.shtml HTTP/1.1
host: www.cmu.edu

HTTP/1.1 200 OK
Date: Fri, 29 Oct 2010 19:41:08 GMT
Server: Apache/1.3.39 (Unix) mod_pubcookie/3.3.3 ... 
Transfer-Encoding: chunked
Content-Type: text/html
...
Connection closed by foreign host.
unix>
HTTP Requests

- HTTP request is a *request line*, followed by zero or more *request headers*

**Request line:** `<method> <uri> <version>`
- `<method>` is one of GET, POST, OPTIONS, HEAD, PUT, DELETE, or TRACE
- `<uri>` is typically URL for proxies, URL suffix for servers
  - A URL is a type of URI (Uniform Resource Identifier)
- `<version>` is HTTP version of request *(HTTP/1.0 or HTTP/1.1)*
HTTP Requests (cont)

- **HTTP methods:**
  - **GET:** Retrieve static or dynamic content
    - Arguments for dynamic content are in URI
    - Workhorse method (99% of requests)
  - **POST:** Retrieve dynamic content
    - Arguments for dynamic content are in the request body
  - **OPTIONS:** Get server or file attributes
  - **HEAD:** Like GET but no data in response body
  - **PUT:** Write a file to the server!
  - **DELETE:** Delete a file on the server!
  - **TRACE:** Echo request in response body
    - Useful for debugging

- **Request headers:** `<header name>`: `<header data>`
  - Provide additional information to the server
HTTP Versions

- Major differences between HTTP/1.1 and HTTP/1.0
  - HTTP/1.0 uses a new connection for each transaction
  - HTTP/1.1 also supports *persistent connections*
    - multiple transactions over the same connection
    - Connection: Keep-Alive
  - HTTP/1.1 requires HOST header
    - Host: www.cmu.edu
      - Makes it possible to host multiple websites at single Internet host
  - HTTP/1.1 supports *chunked encoding* (described later)
    - Transfer-Encoding: chunked
  - HTTP/1.1 adds additional support for caching
HTTP Responses

- HTTP response is a response line followed by zero or more response headers, possibly followed by data

- Response line:
  
  `<version> <status code> <status msg>`

  - `<version>` is HTTP version of the response
  - `<status code>` is numeric status
  - `<status msg>` is corresponding English text
    - 200 OK Request was handled without error
    - 301 Moved Provide alternate URL
    - 403 Forbidden Server lacks permission to access file
    - 404 Not found Server couldn’t find the file

- Response headers: `<header name>`: `<header data>`
  
  - Provide additional information about response
  - `Content-Type`: MIME type of content in response body
  - `Content-Length`: Length of content in response body
GET Request to Apache Server
From Firefox Browser

URI is just the suffix, not the entire URL

```
GET /~bryant/test.html HTTP/1.1
Host: www.cs.cmu.edu
User-Agent: Mozilla/5.0 (Windows; U; Windows NT 6.0; en-US; rv: 1.9.2.11) Gecko/20101012 Firefox/3.6.11
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,*/*;q=0.8
Accept-Language: en-us,en;q=0.5
Accept-Encoding: gzip, deflate
Accept-Charset: ISO-8859-1,utf-8;q=0.7,*;q=0.7
Keep-Alive: 115
Connection: keep-alive
CRLF (\r\n)
```
GET Response From Apache Server

HTTP/1.1 200 OK
Date: Fri, 29 Oct 2010 19:48:32 GMT
Server: Apache/2.2.14 (Unix) mod_ssl/2.2.14 OpenSSL/0.9.7m mod_pubcookie/3.3.2b PHP/5.3.1
Accept-Ranges: bytes
Content-Length: 479
Keep-Alive: timeout=15, max=100
Connection: Keep-Alive
Content-Type: text/html
<html>
<head><title>Some Tests</title></head>

<body>
<h1>Some Tests</h1>
...
</body>
</html>
Proxies

- A *proxy* is an intermediary between a client and an *origin server*
  - To the client, the proxy acts like a server
  - To the server, the proxy acts like a client
Why Proxies?

- Can perform useful functions as requests and responses pass by
  - Examples: Caching, logging, anonymization, filtering, transcoding
Two types of web proxy

- **Explicit (browser-known) proxies**
  - Used by configuring browser to send requests to proxy
  - Each request specifies entire URL
    - allowing proxy to know target server

- **Transparent proxies**
  - Browser/client behaves as though there is no proxy
  - Proxy runs on network component in route between client and server
    - intercepting and interposing on web requests
Tiny Web Server

- Tiny Web server described in text
  - Tiny is a sequential Web server
  - Serves static and dynamic content to real browsers
    - text files, HTML files, GIF and JPEG images
  - 226 lines of commented C code
  - Not as complete or robust as a real web server
Tiny Operation

- Accept connection from client
- Read request from client (via connected socket)
- Split into method / uri / version
  - If not GET, then return error
- If URI contains “cgi-bin” then serve dynamic content
  - (Would do wrong thing if had file “abcgi-bingo.html”)
  - Fork process to execute program
- Otherwise serve static content
  - Copy file to output
Tiny Serving Static Content

/* Send response headers to client */
get_filetype(filename, filetype);
sprintf(buf, "HTTP/1.0 200 OK\r\n");
sprintf(buf, "%sServer: Tiny Web Server\r\n", buf);
sprintf(buf, "%sContent-length: %d\r\n", buf, filesize);
sprintf(buf, "%sContent-type: %s\r\n\r
", buf, filetype);
Rio_writen(fd, buf, strlen(buf));

/* Send response body to client */
srcfd = Open(filename, O_RDONLY, 0);
srcp = Mmap(0, filesize, PROT_READ, MAP_PRIVATE, srcfd, 0);
Close(srcfd);
Rio_writen(fd, srcp, filesize);
Munmap(srcp, filesize);

- Serve file specified by filename
- Use file metadata to compose header
- “Read” file via mmap
- Write to output
Serving Dynamic Content

- Client sends request to server
  
  ```
  GET /cgi-bin/env.pl HTTP/1.1
  ```

- If request URI contains the string "/cgi-bin", then the server assumes that the request is for dynamic content
The server creates a child process and runs the program identified by the URI in that process.
Serving Dynamic Content (cont)

- The child runs and generates the dynamic content
- The server captures the content of the child and forwards it without modification to the client
Issues in Serving Dynamic Content

- How does the client pass program arguments to the server?
- How does the server pass these arguments to the child?
- How does the server pass other info relevant to the request to the child?
- How does the server capture the content produced by the child?
- These issues are addressed by the Common Gateway Interface (CGI) specification.
Because the children are written according to the CGI spec, they are often called *CGI programs*.

Because many CGI programs are written in Perl, they are often called *CGI scripts*.

However, CGI really defines a simple standard for transferring information between the client (browser), the server, and the child process.
The add.com Experience

input URL  host  port  CGI program  args

Welcome to add.com: THE Internet addition portal.
The answer is: 15213 + 18243 -> 33456
Thanks for visiting!

Output page
Serving Dynamic Content With GET

- **Question**: How does the client pass arguments to the server?
- **Answer**: The arguments are appended to the URI
- **Can be encoded directly in a URL typed to a browser or a URL in an HTML link**
  - `http://add.com/cgi-bin/adder?n1=15213&n2=18243`
  - `adder` is the CGI program on the server that will do the addition.
  - argument list starts with “? “
  - arguments separated by “&”
  - spaces represented by “+” or “%20”
Serving Dynamic Content With GET

- **URL:**
  - `cgi-bin/adder?n1=15213&n2=18243`

- **Result displayed on browser:**

  Welcome to add.com: THE Internet addition portal. The answer is: 15213 + 18243 -> 33456
  Thanks for visiting!
Serving Dynamic Content With GET

- **Question**: How does the server pass these arguments to the child?
- **Answer**: In environment variable QUERY_STRING
  - A single string containing everything after the “?”
  - For add: QUERY_STRING = “n1=15213&n2=18243”

```c
if ((buf = getenv("QUERY_STRING")) != NULL) {
    if (sscanf(buf, "n1=%d&n2=%d\n", &n1, &n2) == 2)
        sprintf(msg, "%d + %d -> %d\n", n1, n2, n1+n2);
    else
        sprintf(msg, "Can't parse buffer '%s'\n", buf);
}
```

From `adder.c`
Additional CGI Environment Variables

- **General**
  - SERVER_SOFTWARE
  - SERVER_NAME
  - GATEWAY_INTERFACE (CGI version)

- **Request-specific**
  - SERVER_PORT
  - REQUEST_METHOD (GET, POST, etc)
  - QUERY_STRING (contains GET args)
  - REMOTE_HOST (domain name of client)
  - REMOTE_ADDR (IP address of client)
  - CONTENT_TYPE (for POST, type of data in message body, e.g., text/html)
  - CONTENT_LENGTH (length in bytes)
Even More CGI Environment Variables

- In addition, the value of each header of type *type* received from the client is placed in environment variable `HTTP_type`
  - Examples (any “-” is changed to “_”) :
    - `HTTP_ACCEPT`
    - `HTTP_HOST`
    - `HTTP_USER_AGENT`
**Serving Dynamic Content With GET**

- **Question:** How does the server capture the content produced by the child?
- **Answer:** The child generates its output on `stdout`. Server uses `dup2` to redirect `stdout` to its connected socket.
  - Notice that only the child knows the type and size of the content. Thus the child (not the server) must generate the corresponding headers.

```c
/* Make the response body */
sprintf(content, "Welcome to add.com: ");
sprintf(content, "%sTHE Internet addition portal.\r\n<p>", content);
sprintf(content, "%sThe answer is: %s\r\n<p>", content, msg);
sprintf(content, "%sThanks for visiting!\r\n", content);

/* Generate the HTTP response */
printf("Content-length: %u\r\n", (unsigned) strlen(content));
printf("Content-type: text/html\r\n\r\n");
printf("%s", content);
```

From `adder.c`
Serving Dynamic Content With GET

```plaintext
linux> telnet greatwhite.ics.cs.cmu.edu 15213
Trying 128.2.220.10...
Connected to greatwhite.ics.cs.cmu.edu (128.2.220.10).
```

```plaintext
GET /cgi-bin/adder?n1=5&n2=27 HTTP/1.1
host: greatwhite.ics.cs.cmu.edu
```

```
HTTP request sent by client
```

```
HTTP/1.0 200 OK
Server: Tiny Web Server
Content-length: 109
Content-type: text/html
```

```
Welcome to add.com: THE Internet addition portal.
<p>The answer is: 5 + 27 -> 32
```

```
HTTP response generated by the server
```

```
<p>Thanks for visiting!
Connection closed by foreign host.
```

```
HTTP response generated by the CGI program
```
Tiny Serving Dynamic Content

/* Return first part of HTTP response */
sprintf(buf, "HTTP/1.0 200 OK\r\n");
Rio_writen(fd, buf, strlen(buf));
sprintf(buf, "Server: Tiny Web Server\r\n");
Rio_writen(fd, buf, strlen(buf));

if (Fork() == 0) { /* child */
    /* Real server would set all CGI vars here */
    setenv("QUERY_STRING", cgiargs, 1);
    Dup2(fd, STDOUT_FILENO); /* Redirect stdout to client */
    Execve(filename, emptylist, environ); /* Run CGI prog */
}
Wait(NULL); /* Parent waits for and reaps child */

- Fork child to execute CGI program
- Change stdout to be connection to client
- Execute CGI program with execve
Data Transfer Mechanisms

- **Standard**
  - Specify total length with content-length
  - Requires that program buffer entire message

- **Chunked**
  - Break into blocks
  - Prefix each block with number of bytes (Hex coded)
Chunked Encoding Example

```
HTTP/1.1 200 OK
Date: Sun, 31 Oct 2010 20:47:48 GMT
Server: Apache/1.3.41 (Unix)
Keep-Alive: timeout=15, max=100
Connection: Keep-Alive
Transfer-Encoding: chunked
Content-Type: text/html

First Chunk: 0xd75 = 3445 bytes

<html>
<head>
  <link href="http://www.cs.cmu.edu/style/calendar.css" rel="stylesheet" type="text/css">
</head>
<body id="calendar_body">

  <div id='calendar'><table width='100%' border='0' cellspacing='1' id='cal'>
    ...
  </div>
</body>
</html>

Second Chunk: 0 bytes (indicates last chunk)
```
For More Information

- **Study the Tiny Web server described in your text**
  - Tiny is a sequential Web server.
  - Serves static and dynamic content to real browsers.
    - text files, HTML files, GIF and JPEG images.
  - 220 lines of commented C code.
  - Also comes with an implementation of the CGI script for the add.com addition portal.

- **See the HTTP/1.1 standard:**
  - [http://www.w3.org/Protocols/rfc2616/rfc2616.html](http://www.w3.org/Protocols/rfc2616/rfc2616.html)
URLs

- Each file managed by a server has a unique name called a URL (Universal Resource Locator)

- URLs for static content:
  - http://www.cs.cmu.edu
    - Identifies a file called index.html, managed by a Web server at www.cs.cmu.edu that is listening on port 80

- URLs for dynamic content:
    - Identifies an executable file called proc, managed by a Web server at www.cs.cmu.edu that is listening on port 8000, that should be called with two argument strings: 15000 and 213
