

Carnegie Mellon

Introduction to Computer Systems

15-213/18-243, fall 2009
7th Lecture, Sep. 14th

Instructors:
Roger B. Dannenberg and Greg Ganger

Carnegie Mellon

Last Time

- For loops
 - for loop → while loop → do-while loop → goto version
 - for loop → while loop → goto “jump to middle” version
- Switch statements
 - Jump tables: `jmp *.L62(, %edx, 4)`
 - Decision trees (not shown)

Jump table

```
.section .rodata
.align 4
.L62:
    .long .L61 # x = 0
    .long .L56 # x = 1
    .long .L57 # x = 2
    .long .L58 # x = 3
    .long .L61 # x = 4
    .long .L60 # x = 5
    .long .L60 # x = 6
```

2

Carnegie Mellon

Last Time

- Procedures (IA32)
 - call / return
 - %esp, %ebp
 - local variables
 - recursive functions

Caller-Save

- %eax
- %edx
- %ecx

Callee-Save

- %ebx
- %esi
- %edi

Special

- %esp
- %ebp

Caller Frame

- Arguments
- Return Addr
- Old %ebp

%ebp → Saved Registers + Local Variables

%esp → Argument Build

3

Carnegie Mellon

Today

- Procedures (x86-64)
- Arrays
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- Structures

4

Carnegie Mellon

x86-64 Integer Registers

%rax	%eax	%r8	%r8d
%rbx	%ebx	%r9	%r9d
%rcx	%ecx	%r10	%r10d
%rdx	%edx	%r11	%r11d
%rsi	%esi	%r12	%r12d
%rdi	%edi	%r13	%r13d
%rsp	%esp	%r14	%r14d
%rbp	%ebp	%r15	%r15d

- Twice the number of registers
- Accessible as 8, 16, 32, 64 bits

5

Carnegie Mellon

x86-64 Integer Registers

%rax	Return value	%r8	Argument #5
%rbx	Callee saved	%r9	Argument #6
%rcx	Argument #4	%r10	Callee saved
%rdx	Argument #3	%r11	Used for linking
%rsi	Argument #2	%r12	C: Callee saved
%rdi	Argument #1	%r13	Callee saved
%rsp	Stack pointer	%r14	Callee saved
%rbp	Callee saved	%r15	Callee saved

6

x86-64 Registers

- Arguments passed to functions via registers
 - If more than 6 integral parameters, then pass rest on stack
 - These registers can be used as caller-saved as well
- All references to stack frame via stack pointer
 - Eliminates need to update `%ebp/%rbp`
- Other Registers
 - 6+1 callee saved
 - 2 or 3 have special uses

7

x86-64 Long Swap

```
void swap(long *xp, long *yp)
{
    long t0 = *xp;
    long t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

```
swap:
    movq    (%rdi), %rdx
    movq    (%rsi), %rax
    movq    %rax, (%rdi)
    movq    %rdx, (%rsi)
    ret
```

- Operands passed in registers
 - First (`xp`) in `%rdi`, second (`yp`) in `%rsi`
 - 64-bit pointers
- No stack operations required (except `ret`)
- Avoiding stack
 - Can hold all local information in registers

8

x86-64 Locals in the Red Zone

```
/* Swap, using local array */
void swap_a(long *xp, long *yp)
{
    volatile long loc[2];
    loc[0] = *xp;
    loc[1] = *yp;
    *xp = loc[1];
    *yp = loc[0];
}
```

```
swap_a:
    movq    (%rdi), %rax
    movq    %rax, -24(%rsp)
    movq    (%rsi), %rax
    movq    %rax, -16(%rsp)
    movq    -16(%rsp), %rax
    movq    %rax, (%rdi)
    movq    -24(%rsp), %rax
    movq    %rax, (%rsi)
    ret
```

- Avoiding Stack Pointer Change
 - Can hold all information within small window beyond stack pointer

9

x86-64 NonLeaf without Stack Frame

```
long count = 0;

/* Swap a[i] & a[i+1] */
void swap_ele_se(
    long a[], int i)
{
    swap(&a[i], &a[i+1]);
    count++;
}
```

- No values held while swap being invoked
- No callee save registers needed

```
swap_ele_se:
    movslq  %esi, %rsi          # Sign extend i
    leaq    (%rdi, %rsi, 8), %rdi # &a[i]
    leaq    8(%rdi), %rsi       # &a[i+1]
    call    swap                # swap()
    incq    %count(%rip)        # count++;
    ret
```

10

x86-64 Call using Jump

```
long count = 0;

/* Swap a[i] & a[i+1] */
void swap_ele(long a[], int i)
{
    swap(&a[i], &a[i+1]);
}
```

```
swap_ele:
    movslq  %esi, %rsi
    leaq    (%rdi, %rsi, 8), %rdi
    leaq    8(%rdi), %rsi
    jmp     swap
```

Will disappear
Blackboard?

11

x86-64 Call using Jump

```
long count = 0;

/* Swap a[i] & a[i+1] */
void swap_ele(long a[], int i)
{
    swap(&a[i], &a[i+1]);
}
```

- When swap executes `ret`, it will return from `swap_ele`
- Possible since swap is a "tail call" (no instructions afterwards)

```
swap_ele:
    movslq  %esi, %rsi          # Sign extend i
    leaq    (%rdi, %rsi, 8), %rdi # &a[i]
    leaq    8(%rdi), %rsi       # &a[i+1]
    jmp     swap                # swap()
```

12

Carnegie Mellon

x86-64 Stack Frame Example

```

long sum = 0;
/* Swap a[i] & a[i+1] */
void swap_ele_su
(long a[], int i)
{
    swap(&a[i], &a[i+1]);
    sum += a[i];
}

```

```

swap_ele_su:
movq    %rbx, -16(%rsp)
movslq  %esi, %rbx
movq    %r12, -8(%rsp)
movq    %rdi, %r12
leaq    (%rdi, %rbx, 8), %rdi
subq    $16, %rsp
leaq    8(%rdi), %rsi
call    swap
movq    (%r12, %rbx, 8), %rax
addq    %rax, sum(%rip)
movq    (%rsp), %rbx
movq    8(%rsp), %r12
addq    $16, %rsp
ret

```

- Keeps values of a and i in callee save registers
- Must set up stack frame to save these registers

Blackboard?

13

Carnegie Mellon

Understanding x86-64 Stack Frame

```

swap_ele_su:
movq    %rbx, -16(%rsp)    # Save %rbx
movslq  %esi, %rbx        # Extend & save i
movq    %r12, -8(%rsp)    # Save %r12
movq    %rdi, %r12        # Save a
leaq    (%rdi, %rbx, 8), %rdi # &a[i]
subq    $16, %rsp         # Allocate stack frame
leaq    8(%rdi), %rsi      # &a[i+1]
call    swap              # swap()
movq    (%r12, %rbx, 8), %rax # a[i]
addq    %rax, sum(%rip)    # sum += a[i]
movq    (%rsp), %rbx      # Restore %rbx
movq    8(%rsp), %r12     # Restore %r12
addq    $16, %rsp         # Deallocate stack frame
ret

```

14

Carnegie Mellon

Understanding x86-64 Stack Frame

```

swap_ele_su:
movq    %rbx, -16(%rsp)    # Save %rbx
movq    %r12, -8(%rsp)    # Save %r12

subq    $16, %rsp         # Allocate stack frame

movq    (%rsp), %rbx      # Restore %rbx
movq    8(%rsp), %r12     # Restore %r12
addq    $16, %rsp         # Deallocate stack frame

```

%rsp →

-8	%r12
-16	%rbx

+8

%r12
%rbx

%rsp →

15

Carnegie Mellon

Interesting Features of Stack Frame

- **Allocate entire frame at once**
 - All stack accesses can be relative to %rsp
 - Do by decrementing stack pointer
 - Can delay allocation, since safe to temporarily use red zone
- **Simple deallocation**
 - Increment stack pointer
 - No base/frame pointer needed

16

Carnegie Mellon

x86-64 Procedure Summary

- **Heavy use of registers**
 - Parameter passing
 - More temporaries since more registers
- **Minimal use of stack**
 - Sometimes none
 - Allocate/deallocate entire block
- **Many tricky optimizations**
 - What kind of stack frame to use
 - Calling with jump
 - Various allocation techniques

17

Carnegie Mellon

Today

- **Procedures (x86-64)**
- **Arrays**
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- **Structures**

18

Carnegie Mellon

Basic Data Types

■ Integral

Stored & operated on in general (integer) registers

Signed vs. unsigned depends on instructions used

Intel	GAS	Bytes	C
byte	b	1	[unsigned] char
word	w	2	[unsigned] short
double word	l	4	[unsigned] int
quad word	q	8	[unsigned] long int (x86-64)

■ Floating Point

Stored & operated on in floating point registers

Intel	GAS	Bytes	C
Single	s	4	float
Double	l	8	double
Extended	t	10/12/16	long double

19

Carnegie Mellon

Array Allocation

■ Basic Principle

$T\ A[L];$

Array of data type T and length L

Contiguously allocated region of $L * \text{sizeof}(T)$ bytes

char string[12];

int val[5];

double a[3];

char *p[3];

Diagram showing memory layout for string, val, a, and p arrays with pointers and offsets.

IA32 and x86-64 labels are present.

20

Carnegie Mellon

Array Access

■ Basic Principle

$T\ A[L];$

Array of data type T and length L

Identifier A can be used as a pointer to array element 0: Type T^*

int val[5];

Diagram showing array elements and pointers.

■ Reference

Type	Value
val[4]	
val	
val+1	
&val[2]	
val[5]	
*(val+1)	
val + i	

Will disappear Blackboard?

21

Carnegie Mellon

Array Access

■ Basic Principle

$T\ A[L];$

Array of data type T and length L

Identifier A can be used as a pointer to array element 0: Type T^*

int val[5];

Diagram showing array elements and pointers.

■ Reference

Type	Value	
val[4]	int	3
val	int *	x
val+1	int *	x+4
&val[2]	int *	x+8
val[5]	int	??
*(val+1)	int	5
val + i	int *	x+4 i

22

Carnegie Mellon

Array Example

typedef int zip_dig[5];

zip_dig cmu = { 1, 5, 2, 1, 3 };

zip_dig mit = { 0, 2, 1, 3, 9 };

zip_dig ucb = { 9, 4, 7, 2, 0 };

zip_dig cmu;

zip_dig mit;

zip_dig mit;

■ Declaration "zip_dig cmu" equivalent to "int cmu[5]"

■ Example arrays were allocated in successive 20 byte blocks

■ Not guaranteed to happen in general

23

Carnegie Mellon

Array Accessing Example

zip_dig cmu;

Diagram showing array elements and pointers.

int get_digit

(zip_dig z, int dig)

{

return z[dig];

}

IA32

%edx = z

%eax = dig

movl (%edx,%eax,4),%eax

z[dig]

■ Register %edx contains starting address of array

■ Register %eax contains array index

■ Desired digit at 4*%eax + %edx

■ Use memory reference (%edx,%eax,4)

Carnegie Mellon

Array Loop Example

Original

Transformed

As generated by GCC

Eliminate loop variable i

Convert array code to pointer code

Express in do-while form (no test at entrance)

int zd2int(zip_dig z)

{

int i;

int zi = 0;

for (i = 0; i < 5; i++) {

zi = 10 * zi + z[i];

}

return zi;

}

int zd2int(zip_dig z)

{

int zi = 0;

int *zend = z + 4;

do {

zi = 10 * zi + *z;

z++;

} while (z <= zend);

return zi;

}

27

Carnegie Mellon

Array Loop Implementation (IA32)

int zd2int(zip_dig z)

{

int zi = 0;

int *zend = z + 4;

do {

zi = 10 * zi + *z;

z++;

} while (z <= zend);

return zi;

}

5*zi

*z

z++

zi = *z + 2*(5*zi)

z : zend

if <= goto loop

29

Carnegie Mellon

Nested Array Example

#define PCOUNT 4

zip_dig pgh[PCOUNT] =

{{1, 5, 2, 0, 6},

{1, 5, 2, 1, 3 },

{1, 5, 2, 1, 7 },

{1, 5, 2, 2, 1 }};

zip_dig

pgh[4];

7696116136156

"zip_dig pgh[4]" equivalent to "int pgh[4][5]"

Variable pgh: array of 4 elements, allocated contiguously

Each element is an array of 5 int's, allocated contiguously

"Row-Major" ordering of all elements guaranteed

30

Multidimensional (Nested) Arrays

- Declaration**

```
T A[R][C];
```

 - 2D array of data type T
 - R rows, C columns
 - Type T element requires K bytes
- Array Size**
 - $R * C * K$ bytes
- Arrangement**
 - Row-Major Ordering

int A[R][C];

4*R*C Bytes

31

Nested Array Row Access

- Row Vectors**
 - $A[i]$ is array of C elements
 - Each element of type T requires K bytes
 - Starting address $A + i * (C * K)$

```
int A[R][C];
```

$A + i * C * 4$

$A + (R-1) * C * 4$

32

Nested Array Row Access Code

```
int *get_pgh_zip(int index)
{
    return pgh[index];
}

#define PCOUNT 4
zip_dig pgh[PCOUNT] =
{
    {1, 5, 2, 0, 6},
    {1, 5, 2, 1, 3},
    {1, 5, 2, 1, 7},
    {1, 5, 2, 2, 1}};
```

- What data type is $pgh[index]$?
- What is its starting address?

```
# %eax = index
leal (%eax,%eax,4),%eax
leal pgh(,%eax,4),%eax
```

Will disappear Blackboard?

33

Nested Array Row Access Code

```
int *get_pgh_zip(int index)
{
    return pgh[index];
}

#define PCOUNT 4
zip_dig pgh[PCOUNT] =
{
    {1, 5, 2, 0, 6},
    {1, 5, 2, 1, 3},
    {1, 5, 2, 1, 7},
    {1, 5, 2, 2, 1}};
```

```
# %eax = index
leal (%eax,%eax,4),%eax # 5 * index
leal pgh(,%eax,4),%eax # pgh + (20 * index)
```

- Row Vector**
 - $pgh[index]$ is array of 5 int's
 - Starting address $pgh + 20 * index$
- IA32 Code**
 - Computes and returns address
 - Compute as $pgh + 4 * (index + 4 * index)$

34

Nested Array Row Access

- Array Elements**
 - $A[i][j]$ is element of type T , which requires K bytes
 - Address $A + i * (C * K) + j * K = A + (i * C + j) * K$

```
int A[R][C];
```

$A + i * C * 4$

$A + i * C * 4 + j * 4$

35

Nested Array Element Access Code

```
int get_pgh_digit
(int index, int dig)
{
    return pgh[index][dig];
}

# %ecx = dig
# %eax = index
leal 0(,%ecx,4),%edx # 4*dig
leal (%eax,%eax,4),%eax # 5*index
movl pgh(%edx,%eax,4),%eax # *(pgh + 4*dig + 20*index)
```

- Array Elements**
 - $pgh[index][dig]$ is int
 - Address: $pgh + 20 * index + 4 * dig$
- IA32 Code**
 - Computes address $pgh + 4 * dig + 4 * (index + 4 * index)$
 - `movl` performs memory reference

Strange Referencing Examples

Reference	Address	Value	Guaranteed?
univ[2][3]	56+4*3 = 68	2	Yes
univ[1][5]	16+4*5 = 36	0	No
univ[2][-1]	56+4*-1 = 52	9	No
univ[3][-1]	??	??	No
univ[1][12]	16+4*12 = 64	7	No

- Code does not do any bounds checking
- Ordering of elements in different arrays not guaranteed

Using Nested Arrays

- Strengths**
 - C compiler handles doubly subscripted arrays
 - Generates very efficient code
 - Avoids multiply in index computation
- Limitation**
 - Only works for fixed array size

```
#define N 16
typedef int fix_matrix[N][N];

/* Compute element i,k of
fixed matrix product */
int fix_prod_ele
(fix_matrix a, fix_matrix b,
int i, int k)
{
    int j;
    int result = 0;
    for (j = 0; j < N; j++)
        result += a[i][j]*b[j][k];
    return result;
}
```

Dynamic Nested Arrays

- Strength**
 - Can create matrix of any size
- Programming**
 - Must do index computation explicitly
- Performance**
 - Accessing single element costly
 - Must do multiplication

```
int * new_var_matrix(int n)
{
    return (int *)
        calloc(sizeof(int), n*n);
}

int var_ele
(int *a, int i, int j, int n)
{
    return a[i*n+j];
}
```

```
movl 12(%ebp),%eax    # i
movl 8(%ebp),%edx     # a
imull 20(%ebp),%eax   # n*i
addl 16(%ebp),%eax    # n*i+j
movl (%edx,%eax,4),%eax # Mem[a+4*(i*n+j)]
```

Dynamic Array Multiplication

- Without Optimizations**
 - Multiples: 3
 - 2 for subscripts
 - 1 for data
 - Adds: 4
 - 2 for array indexing
 - 1 for loop index
 - 1 for data

```
/* Compute element i,k of
variable matrix product */
int var_prod_ele
(int *a, int *b,
int i, int k, int n)
{
    int j;
    int result = 0;
    for (j = 0; j < n; j++)
        result +=
            a[i*n+j] * b[j*n+k];
    return result;
}
```

Optimizing Dynamic Array Multiplication

- Optimizations**
 - Performed when set optimization level to -O2
- Code Motion**
 - Expression $i*n$ can be computed outside loop
- Strength Reduction**
 - Incrementing j has effect of incrementing $j*n+k$ by n
- Operations count**
 - 4 adds, 1 mult
- Compiler can optimize regular access patterns**

```
{
    int j;
    int result = 0;
    for (j = 0; j < n; j++)
        result +=
            a[i*n+j] * b[j*n+k];
    return result;
}
```

```
{
    int j;
    int result = 0;
    int iTn = i*n;
    int jTnPn = k;
    for (j = 0; j < n; j++) {
        result +=
            a[iTn+j] * b[jTnPn];
        jTnPn += n;
    }
    return result;
}
```

Today

- Procedures (x86-64)
- Arrays
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- Structures

49

Structures

```
struct rec {
    int i;
    int a[3];
    int *p;
};
```

Memory Layout

Concept

- Contiguously-allocated region of memory
- Refer to members within structure by names
- Members may be of different types

Accessing Structure Member

```
void
set_i(struct rec *r,
      int val)
{
    r->i = val;
}
```

IA32 Assembly

```
# %eax = val
# %edx = r
movl %eax, (%edx) # Mem[r] = val
```

50

Generating Pointer to Structure Member

```
struct rec {
    int i;
    int a[3];
    int *p;
};
```

Generating Pointer to Array Element

- Offset of each structure member determined at compile time

```
int *find_a
(struct rec *r, int idx)
{
    return &r->a[idx];
}
```

```
# %ecx = idx
# %edx = r
leal 0(, %ecx, 4), %eax # 4*idx
leal 4(%eax, %edx), %eax # r+4*idx+4
```

51

Structure Referencing (Cont.)

C Code

```
struct rec {
    int i;
    int a[3];
    int *p;
};
```

```
void
set_p(struct rec *r)
{
    r->p =
        &r->a[r->i];
}
```

```
# %edx = r
movl (%edx), %ecx # r->i
leal 0(, %ecx, 4), %eax # 4*(r->i)
leal 4(%edx, %eax), %eax # r+4*(r->i)
movl %eax, 16(%edx) # Update r->p
```

52

Summary

- Procedures in x86-64
 - Stack frame is relative to stack pointer
 - Parameters passed in registers
- Arrays
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- Structures
