"The course that gives CMU its Zip!"

Web Services November 10, 2009

Topics

- HTTP
- Serving static content
- Serving dynamic content

class23.ppt

Web History

1989:

- Tim Berners-Lee (CERN) writes internal proposal to develop a distributed hypertext system.
 - Connects "a web of notes with links."
 - Intended to help CERN physicists in large projects share and manage information

1990:

■ Tim BL writes a graphical browser for NeXT machines.

Web History (cont)

1992

- NCSA server released
- 26 WWW servers worldwide

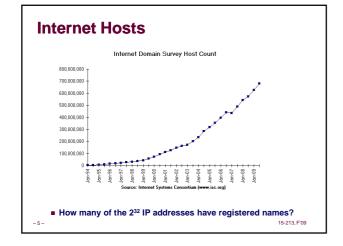

1993

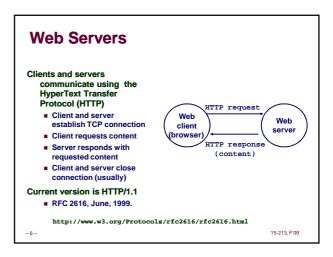

- Marc Andreessen releases first version of NCSA Mosaic browser
- Mosaic version released for (Windows, Mac, Unix).
- Web (port 80) traffic at 1% of NSFNET backbone traffic.
- Over 200 WWW servers worldwide.

1994

 Andreessen and colleagues leave NCSA to form "Mosaic Communications Corp" (predecessor to Netscape).

-4- 15-213, F'09

Web Content

Web servers return content to clients

content: a sequence of bytes with an associated MIME (Multipurpose Internet Mail Extensions) type

Example MIME types

HTML document ■ text/html ■ text/plain Unformatted text ■ application/postscript Postcript document

Binary image encoded in GIF format ■ image/gif

Binary image encoded in JPEG ■ image/ipeg

format

15-213, F'09

MIME and Andrew

Static and Dynamic Content

The content returned in HTTP responses can be either static or dynamic.

- Static content: content stored in files and retrieved in response to an HTTP request
 - Examples: HTML files, images, audio clips.
- Dynamic content: content produced on-the-fly in response to an HTTP request
 - . Example: content produced by a program executed by the

Bottom line: All Web content is associated with a "file" that is managed by the server.

15-213. F'09

URLs

Each file managed by a server has a unique name called a **URL (Universal Resource Locator)**

URLs for static content:

- http://www.cs.cmu.edu:80/index.html
- http://www.cs.cmu.edu/index.html
- http://www.cs.cmu.edu
 - Identifies a file called index.html, managed by a Web server at www.cs.cmu.edu that is listening on port 80.

URLs for dynamic content:

- http://www.cs.cmu.edu:8000/cgi-bin/adder?15000&213
 - Identifies an executable file called adder, managed by a Web server at www.cs.cmu.edu that is listening on port 8000, that should be called with two argument strings: 15000 and 213.

15-213, F'09

How Clients and Servers Use URLs

Example URL: http://www.aol.com:80/index.html

Clients use prefix (http://www.aol.com:80) to infer:

- What kind of server to contact (Web server)
- Where the server is (www.aol.com)
- What port it is listening on (80)

Servers use suffix (/index.html) to:

- Determine if request is for static or dynamic content.
 - No hard and fast rules for this.
 - Convention: executables reside in cgi-bin directory
- Find file on file system.
 - Initial "/" in suffix denotes home directory for requested content.
 - Minimal suffix is "/", which all servers expand to some default home page (e.g., index.html).

Anatomy of an HTTP Transaction

unix> telnet www.aol.com 80 Trying 205.188.146.23... Connected to aol.com.
Escape character is '^]'.

GET / HTTP/1.1 host: www.aol.com

MIME-Version: 1.0 Date: Mon, 08 Jan 2001 04:59:42 GMT Server: NaviServer/2.0 AOLserver/2.3.3

Content-Type: text/html Content-Length: 42092

unix>

<html>

Client: open connection to server Telnet prints 3 lines to the terminal

Client: required HTTP/1.1 HOST header Client: empty line terminates headers. Server: response line Server: followed by five response head

Server: expect HTML in the response body Server: expect 42,092 bytes in the resp body Server: empty line (" $(x \setminus x)$ ") terminates hdrs Server: first HTML line in response body Server: 766 lines of HTML not shown.

Server: last HTML line in response body ction closed by foreign host. Server: closes connection

Client: closes connection and term

HTTP Requests

HTTP request is a request line, followed by zero or more request headers

Request line: <method> <uri> <version>

• See http://www.ietf.org/rfc/rfc2396.txt

- <version> is HTTP version of request (HTTP/1.0 or HTTP/1.1)
- <uri>is typically URL for proxies, URL suffix for servers.
 - A URL is a type of URI (Uniform Resource Identifier)
- <method> is either GET, POST, OPTIONS, HEAD, PUT, DELETE, or TRACE.

-13-

HTTP Requests (cont)

HTTP methods:

- GET: Retrieve static or dynamic content
 - Arguments for dynamic content are in URI
 - Workhorse method (99% of requests)
- POST: Retrieve dynamic content
- Arguments for dynamic content are in the request body
- OPTIONS: Get server or file attributes
- HEAD: Like GET but no data in response body
- PUT: Write a file to the server!
- DELETE: Delete a file on the server!
- TRACE: Echo request in response body
 - Useful for debugging.

-14- 15-213, F'09

HTTP Requests (cont)

(HTTP request is a request line, followed by zero or more request headers)

Request headers: <header name>: <header data>

Provide additional information to the server.

Major differences between HTTP/1.1 and HTTP/1.0

- HTTP/1.0 uses a new connection for each transaction.
- HTTP/1.1 also supports persistent connections
- multiple transactions over the same connection
- Connection: Keep-Alive
- HTTP/1.1 requires HOST header
 - Host: kittyhawk.cmcl.cs.cmu.edu
- HTTP/1.1 supports chunked encoding (described later)
 - Transfer-Encoding: chunked
- -15- HTTP/1.1 adds additional support for caching

15-213, F'09

15-213, F'09

HTTP Responses

HTTP response is a *response line* followed by zero or more *response headers*.

Response line:

<version> <status code> <status msg>

- <version> is HTTP version of the response.
- <status code> is numeric status.
- <status msg> is corresponding English text.
 - 200 OK Request was handled without error
 403 Forbidden Server lacks permission to access file
 - 404 Not found Server couldn't find the file.

Response headers: <header name>: <header data>

- Provide additional information about response
- Content-Type: MIME type of content in response body.
- Content-Length: Length of content in response body.

16- 15-213, F'0

GET Request to Apache Server From IE Browser

URI is just the suffix, not the entire URL

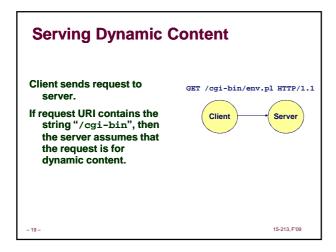

GET /test.html HTTP/1.1
Accept: */*
Accept-Language: en-us
Accept-Encoding: gzip, deflate
User-Agent: Mozilla/4.0 (compatible; MSIE 4.01; Windows 98)
HOSt: euro.ecom.cmu.edu
Connection: Keep-Alive
CRLF (\r\n)

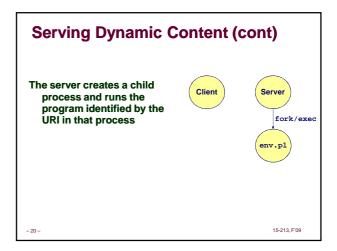

15-213, F'09

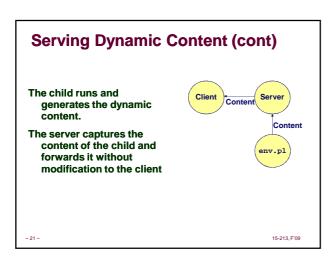

GET Response From Apache Server

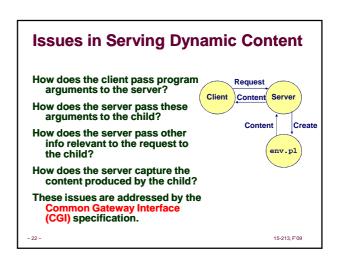

HTTP/1.1 200 OK
Date: Thu, 22 Jul 1999 04:02:15 GMT
Server: Apache/1.3.3 Ben-SSL/1.28 (Unix)
Last-Modified: Thu, 22 Jul 1999 03:33:21 GMT
ETag: "48bb2-4f-37969101"
Accept-Ranges: bytes
Content-Length: 79
Keep-Alive: timeout=15, max=100
Connection: Keep-Alive
Content-Type: text/html
CRLF
<html>
<

Because the children are written according to the CGI spec, they are often called *CGI programs*. Because many CGI programs are written in Perl, they are often called *CGI scripts*. However, CGI really defines a simple standard for transferring information between the client (browser), the server, and the child process.

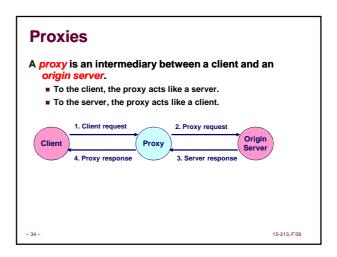

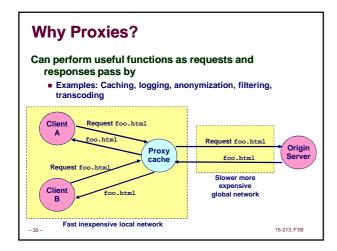

Serving Dynamic Content With GET Question: How does the server pass other info relevant to the request to the child? Answer: In a collection of environment variables defined by the CGI spec.

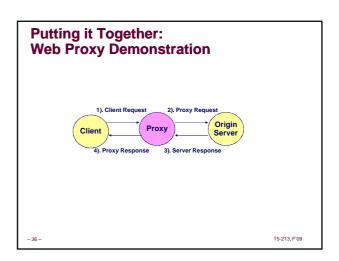

Some CGI Environment Variables General SERVER_SOFTWARE SERVER_NAME GATEWAY_INTERFACE (CGI version) Request-specific SERVER_PORT REQUEST_METHOD (GET, POST, etc) QUERY_STRING (contains GET args) REMOTE_HOST (domain name of client) REMOTE_ADDR (IP address of client) CONTENT_TYPE (for POST, type of data in message body, e.g., text/html) CONTENT_LENGTH (length in bytes)

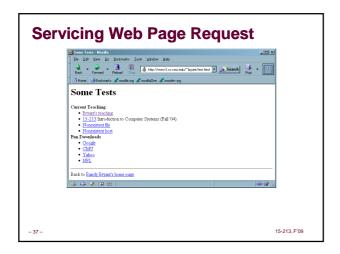

Some CGI Environment Variables In addition, the value of each header of type type received from the client is placed in environment variable HTTP_type • Examples: • HTTP_ACCEPT • HTTP_HOST • HTTP_USER_AGENT (any "-" is changed to "_")

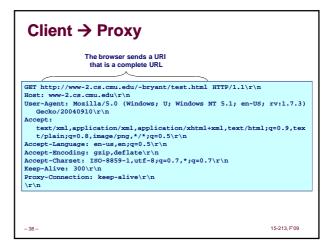

Serving Dynamic Content With GET bass> ./tiny 8000 GET /cgi-bin/adder?1&2 HTTP/1.1 HTTP request received by Tiny Web server Host: bass.cmcl.cs.cmu.edu:8000 kittyhawk> telnet bass 8000 Trying 128.2.222.85... Connected to BASS.CMCL.CS.CMU.EDU. Escape character is '^1'. GET /cgi-bin/adder?1&2 HTTP/1.1 Host: bass.cmcl.cs.cmu.edu:8000 HTTP request sent by client CRLF> HTTP/1.1 200 OK HTTP response generated by Server: Tiny Web Server Content-Tength: 102 the server HTTP response generated by Content-type: text/html the CGI program Welcome to add.com: THE Internet addition portal. cp>The answer is: 1 + 2 = 3 cp>Thanks for visiting!</pr> Connection closed by foreign host. kittyhawk> 15-213, F'09

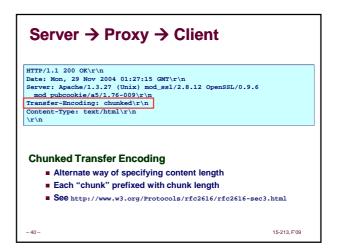

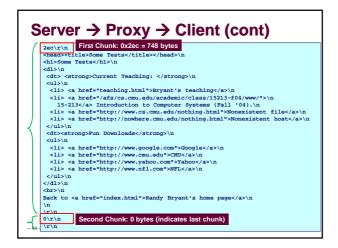

Proxy -> Server The proxy sends a URI that is a path GET /-bryant/test.html HTTP/1.1\r\n Host: www-2.cs.cmu.edu\r\n User-Agent: Mozilla/5.0 (Windows; U; Windows NT 5.1; en-US; rv:1.7.3) Gecko/20040910\r\n Accept: text/xml,application/xml,application/xhtml+xml,text/html;q=0.9,text/plain;q=0.8,image/png,*/*;q=0.5\r\n Accept-Language: en-us,en;q=0.5\r\n Accept-Encoding: gxip,deflate\r\n Accept-Encoding: gxip,deflate\r\n Accept-Charset: ISO-8859-1,utf-8;q=0.7,*;q=0.7\r\n Keep-Alive: 300\r\n Connection: keep-alive\r\n \r\n

For More Information Study the Tiny Web server described in your text 1 Tiny is a sequential Web server. Serves static and dynamic content to real browsers. text files, HTML files, GIF and JPEG images. 220 lines of commented C code. Also comes with an implementation of the CGI script for the add.com addition portal. See the HTTP/1.1 standard: http://www.w3.org/Protocols/rfc2616/rfc2616.html
