15213 Lecture 8: Data in Memory

1 Getting Started

To obtain a copy of today's activity, log into a shark machine and do the following:

- 1. \$ wget http://www.cs.cmu.edu/~213/activities/lec8.tar
- 2. \$ tar xf lec8.tar
- 3. \$ cd lec8

Now run \$./act8 and follow the instructions on your screen. It will occasionally ask you discussion questions, whose answers you can record in the following section. Feel free to refer to the activity sheet from last week if you need a reference of GDB commands.

2 Discussion Questions

Use GDB's c command to progress through the stages. These questions accompany the program; as it poses each one, discuss with your partner and write your answer here.

2.1 Integers

1. Imagine we needed to take the address of the variable local. What problem might we run into, and what do you expect the compiler to do about it?

The variable local is stored in register %edi. The problem is, registers do not have addresses. The compiler will allocate stack space to store the variable as a result.

2.2 Arrays

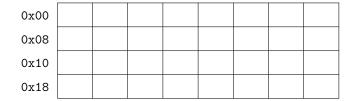

- 2. What is the stride of this array (the number of bytes occupied by each entry)? __4_ bytes
- 3. Assuming you already have a pointer to the beginning of a C string, how do you determine where it ends?

You determine where the string ends by reading the null terminator character: '0' or ASCII character code 0

2.3 Structs

- 4. Did you notice anything familiar about the layout?

 The layout to this 4 integer struct looks the same as the layout to the 4 integer array.
- 5. Write 'a', 'b', 'c', or 'd' in each box based on your prediction of what that byte will contain. If you expect any bytes to be unused, leave them empty.

6. If you were incorrect, lightly cross out the previous table and use this one to record the correct layout as shown in the dump.

0x00	a	X	b	b	c	c	c	c
0x08	d	d	d	d	d	d	d	d
0x10	_	_	_	_	_	_	_	_
0x18	_	_	_	_	_	_	_	_

7. Will this type take up more or less space than the first?
This will take more space than the first due to the order of its elements.

2.4 Arrays of Structs

- 8. What stride do you expect this array to have? ___8__ bytes
- 9. How will this struct's size compare to that of pair? Shorter. This struct's size is 6 bytes vs pair's 8 bytes.

2.5 2-D Arrays

10.	What stride do the	"inner" arra	ys have? _	1	bytes How	about	the "	'outer"	ones? _	3
	bytes									

11.	Do you think this function	n would be useful for	an array declared as:	int8_t	flipped[3][2]?
	No, the outer stride does	not match. It's 2 b	vtes this time.		

- 12. What stride does the outer array have this time? <u>8</u> bytes
- 13. Do you think this function would still be useful if first and second each had 4 elements? How about if they had two different lengths? Yes.

Yes as long as the caller is careful.

14. What effect would we observe if we modified an element of first? It would change under both multilevel[0] and multilevel[1].

2.6 Endianness (Optional)

- 15. What disadvantage of little-endian did you just observe? Little-endianness is harder to read on memory dump.
- 16. How would the assembly of this function differ if x86-64 were a big-endian architecture? mov 4(%rdi), %eax
