

# 15-213

*“The course that gives CMU its Zip!”*

## Integer Arithmetic Operations

### Jan. 25, 2001

#### Topics

- **Basic operations**
  - Addition, negation, multiplication
- **Programming Implications**
  - Consequences of overflow
  - Using shifts to perform power-of-2 multiply/divide

# C Puzzles

- Taken from Exam #2, CS 347, Spring '97
- Assume machine with 32 bit word size, two's complement integers
- For each of the following C expressions, either:
  - Argue that is true for all argument values
  - Give example where not true

Initialization

```
int x = foo();
int y = bar();
unsigned ux = x;
unsigned uy = y;
```

- $x < 0 \Rightarrow ((x*2) < 0)$
- $ux \geq 0$
- $x \& 7 == 7 \Rightarrow (x \ll 30) < 0$
- $ux > -1$
- $x > y \Rightarrow -x < -y$
- $x * x \geq 0$
- $x > 0 \&\& y > 0 \Rightarrow x + y > 0$
- $x \geq 0 \Rightarrow -x \leq 0$
- $x \leq 0 \Rightarrow -x \geq 0$

# Unsigned Addition

Operands:  $w$  bits

True Sum:  $w+1$  bits

Discard Carry:  $w$  bits

$\text{UAdd}_w(u, v)$

## Standard Addition Function

- Ignores carry output

## Implements Modular Arithmetic

$$s = \text{UAdd}_w(u, v) = u + v \bmod 2^w$$

$$\text{UAdd}_w(u, v) = \begin{cases} u + v & u + v < 2^w \\ u + v - 2^w & u + v \geq 2^w \end{cases}$$

# Visualizing Integer Addition

## Integer Addition

- 4-bit integers  $u$  and  $v$
- Compute true sum  $\text{Add}_4(u, v)$
- Values increase linearly with  $u$  and  $v$
- Forms planar surface

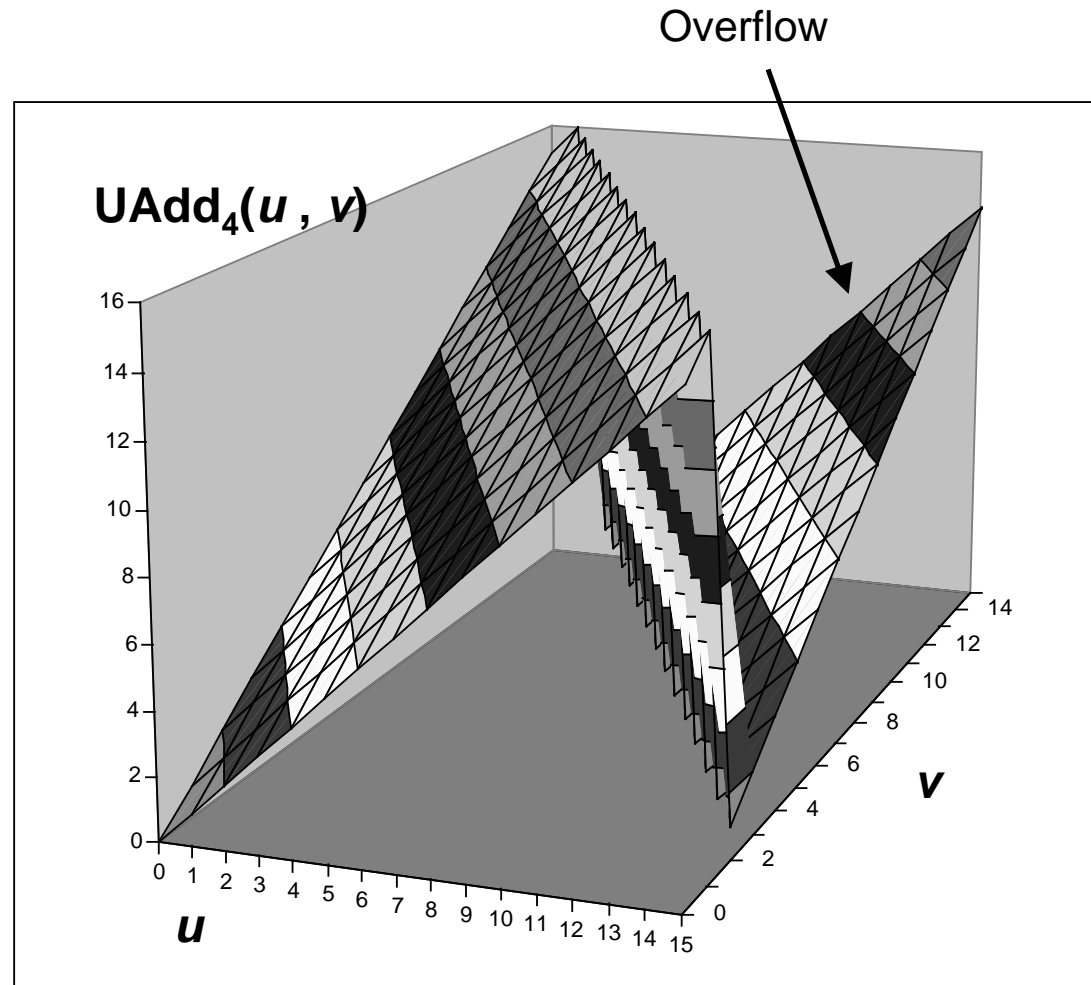

# Visualizing Unsigned Addition

## Wraps Around

- If true sum  $\geq 2^w$
- At most once

## True Sum

# Mathematical Properties

## Modular Addition Forms an *Abelian Group*

- **Closed under addition**

$$0 \leq \text{UAdd}_w(u, v) \leq 2^w - 1$$

- **Commutative**

$$\text{UAdd}_w(u, v) = \text{UAdd}_w(v, u)$$

- **Associative**

$$\text{UAdd}_w(t, \text{UAdd}_w(u, v)) = \text{UAdd}_w(\text{UAdd}_w(t, u), v)$$

- **0 is additive identity**

$$\text{UAdd}_w(u, 0) = u$$

- **Every element has additive inverse**

– Let  $\text{UComp}_w(u) = 2^w - u$

$$\text{UAdd}_w(u, \text{UComp}_w(u)) = 0$$

# Detecting Unsigned Overflow

## Task

- Given  $s = \text{UAdd}_w(u, v)$
- Determine if  $s = u + v$

## Application

unsigned  $s, u, v$ ;

$s = u + v$ ;

- Did addition overflow?

## Claim

- Overflow iff  $s < u$   
 $\text{ovf} = (s < u)$
- Or symmetrically iff  $s < v$

## Proof

- Know that  $0 \leq v < 2^w$
- No overflow  $\Rightarrow s = u + v \geq u + 0 = u$
- Overflow  $\Rightarrow s = u + v - 2^w < u + 0 = u$

## No Overflow

## Overflow

# Two's Complement Addition

Operands:  $w$  bits

True Sum:  $w+1$  bits

Discard Carry:  $w$  bits

$\text{TAdd}_w(u, v)$

## TAdd and UAdd have Identical Bit-Level Behavior

- Signed vs. unsigned addition in C:

```
int s, t, u, v;
```

```
s = (int) ((unsigned) u + (unsigned) v);
```

```
t = u + v
```

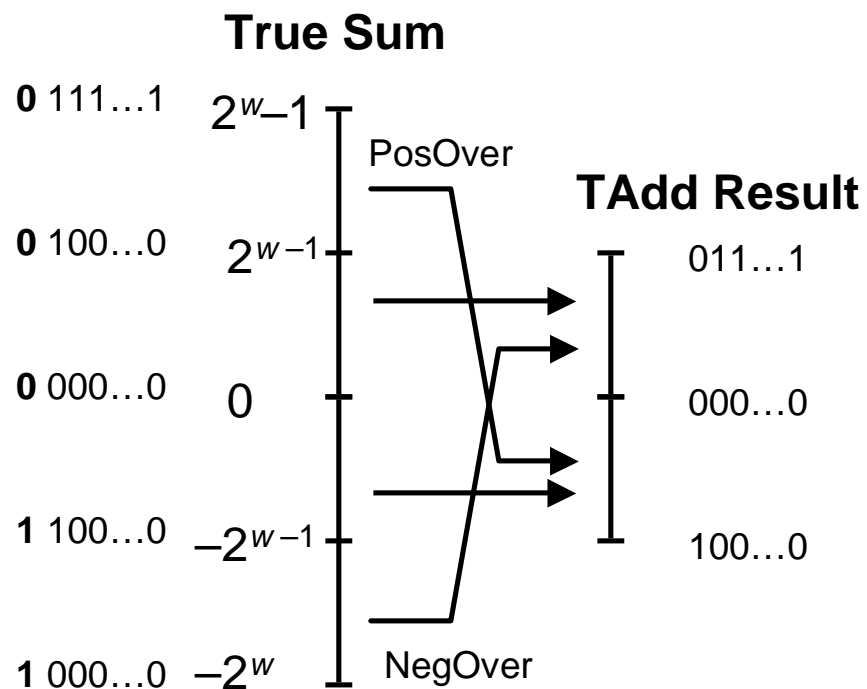

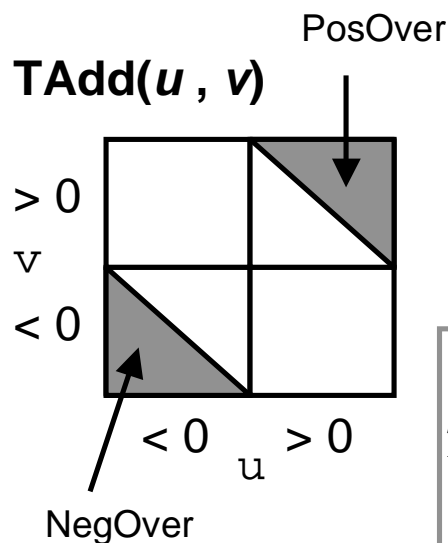

- Will give  $s == t$

# Characterizing TAdd

## Functionality

- True sum requires  $w+1$  bits
- Drop off MSB
- Treat remaining bits as 2's comp. integer

$$TAdd_w(u, v) = \begin{cases} u + v + 2^{w-1} & u + v < TMin_w \text{ (NegOver)} \\ u + v & TMin_w \leq u + v \leq TMax_w \\ u + v - 2^{w-1} & TMax_w < u + v \text{ (PosOver)} \end{cases}$$

# Visualizing 2's Comp. Addition

## Values

- 4-bit two's comp.
- Range from -8 to +7

## Wraps Around

- If  $\text{sum} \geq 2^{w-1}$ 
  - Becomes negative
  - At most once
- If  $\text{sum} < -2^{w-1}$ 
  - Becomes positive
  - At most once

NegOver

# Mathematical Properties of TAdd

## Isomorphic Algebra to UAdd

- $TAdd_w(u, v) = U2T(UAdd_w(T2U(u), T2U(v)))$ 
  - Since both have identical bit patterns

## Two's Complement Under TAdd Forms a Group

- **Closed, Commutative, Associative, 0 is additive identity**
- **Every element has additive inverse**

Let  $TComp_w(u) = U2T(UComp_w(T2U(u)))$

$TAdd_w(u, TComp_w(u)) = 0$

$$TComp_w(u) = \begin{cases} -u & u \neq TMin_w \\ TMin_w & u = TMin_w \end{cases}$$

# Two's Complement Negation

## Mostly like Integer Negation

- $TComp(u) = -u$

## *TMin* is Special Case

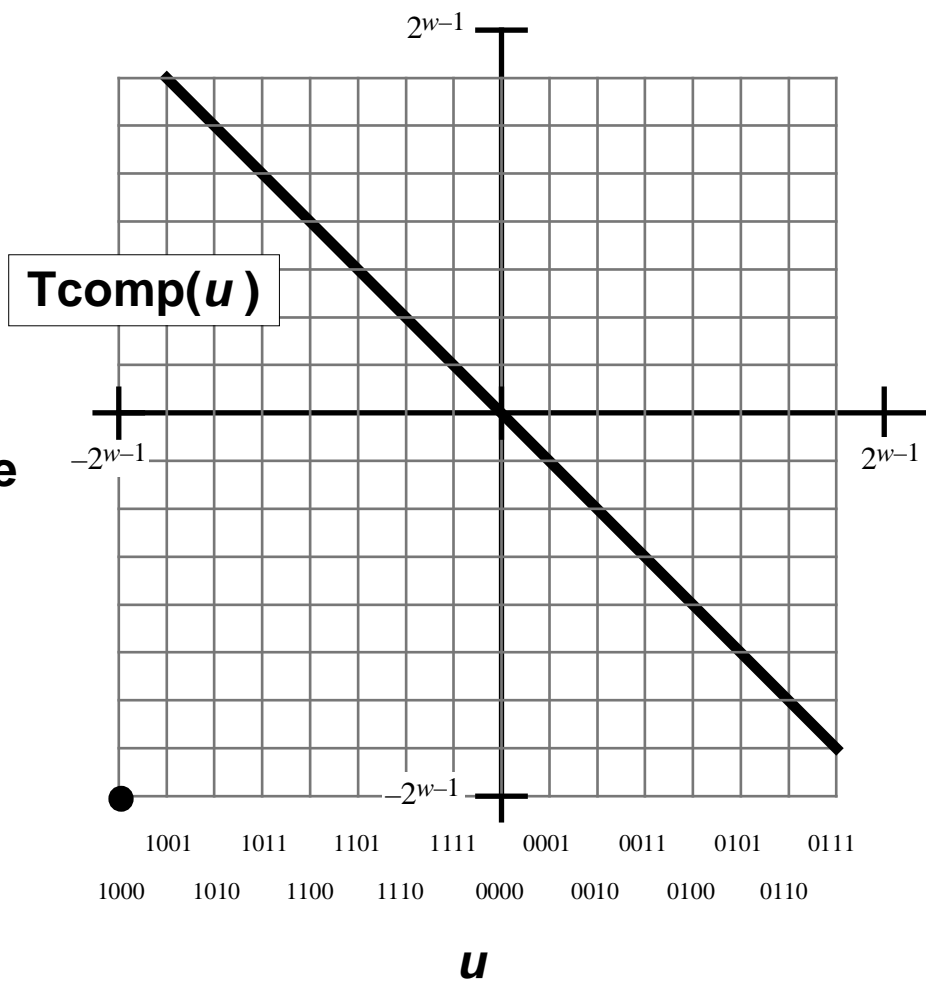

- $TComp(TMin) = TMin$

## Negation in C is Actually TComp

$$mx = -x$$

- $mx = TComp(x)$
- **Computes additive inverse for TAdd**

$$x + -x == 0$$

# Negating with Complement & Increment

## In C

$$\sim x + 1 == -x$$

## Complement

- Observation:  $\sim x + x == 1111\dots11_2 == -1$

$$\begin{array}{r} x \quad 1\ 0\ 0\ 1\ 1\ 1\ 0\ 1 \\ + \quad \sim x \quad 0\ 1\ 1\ 0\ 0\ 0\ 1\ 0 \\ \hline -1 \quad 1\ 1\ 1\ 1\ 1\ 1\ 1\ 1 \end{array}$$

## Increment

- $\sim x + \cancel{x} + (\cancel{-x} + 1) == \cancel{-1} + (-x + \cancel{1})$
- $\sim x + 1 == -x$

## Warning: Be cautious treating `int`'s as integers

- OK here: We are using group properties of TAdd and TComp

# Comp. & Incr. Examples

x = 15213

	Decimal	Hex	Binary
x	15213	3B 6D	00111011 01101101
~x	-15214	C4 92	11000100 10010010
~x+1	-15213	C4 93	11000100 10010011
y	-15213	C4 93	11000100 10010011

TMin

	Decimal	Hex	Binary
TMin	-32768	80 00	10000000 00000000
~TMin	32767	7F FF	01111111 11111111
~TMin+1	-32768	80 00	10000000 00000000

0

	Decimal	Hex	Binary
0	0	00 00	00000000 00000000
~0	-1	FF FF	11111111 11111111
~0+1	0	00 00	00000000 00000000

# Comparing Two's Complement Numbers

## Task

- **Given** signed numbers  $u, v$
- Determine whether or not  $u > v$ 
  - Return 1 for numbers in shaded region below

## Bad Approach

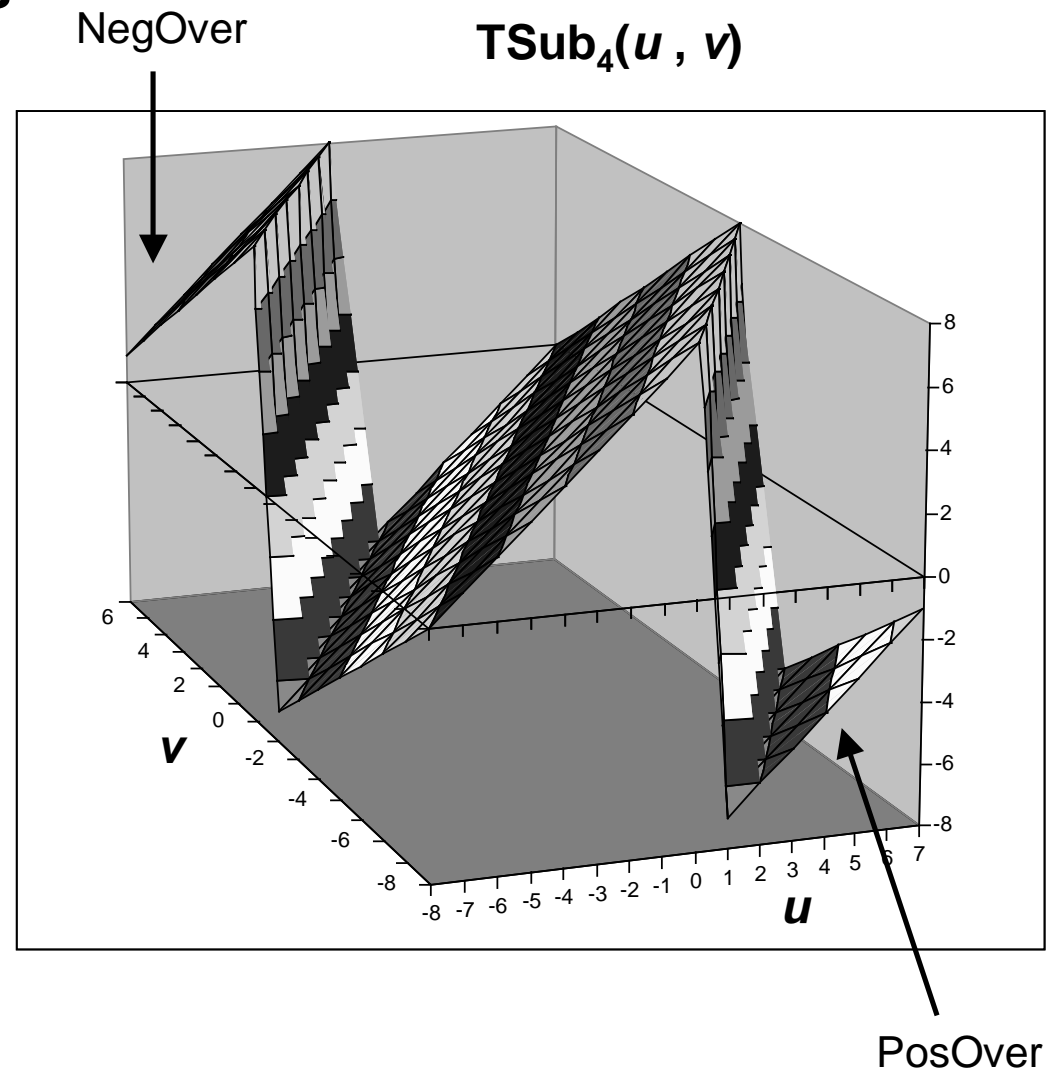

- Test  $(u - v) > 0$ 
  - $TSub(u, v) = TAdd(u, TComp(v))$
- Problem: Thrown off by either Negative or Positive Overflow

# Comparing with TSub

## Will Get Wrong Results

- **NegOver:**  $u < 0, v > 0$   
– but  $u - v > 0$
- **PosOver:**  $u > 0, v < 0$   
– but  $u - v < 0$

# Working Around Overflow Problems

## Partition into Three Regions

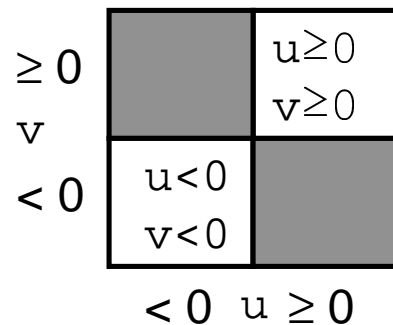

- $u < 0, v \geq 0 \Rightarrow u < v$

- $u \geq 0, v < 0 \Rightarrow u > v$

- $u, v$  same sign  $\Rightarrow u - v$  does not overflow
  - **Can safely use test**  $(u - v) > 0$

# Multiplication

## Computing Exact Product of $w$ -bit numbers $x, y$

- Either signed or unsigned

## Ranges

- **Unsigned:**  $0 \leq x * y \leq (2^w - 1)^2 = 2^{2w} - 2^{w+1} + 1$ 
  - Up to  $2w$  bits
- **Two's complement min:**  $x * y \geq (-2^{w-1}) * (2^{w-1} - 1) = -2^{2w-2} + 2^{w-1}$ 
  - Up to  $2w-1$  bits
- **Two's complement max:**  $x * y \leq (-2^{w-1})^2 = 2^{2w-2}$ 
  - Up to  $2w$  bits, but only for  $TMin_w^2$

## Maintaining Exact Results

- Would need to keep expanding word size with each product computed
- Done in software by “arbitrary precision” arithmetic packages
- Also implemented in Lisp, ML, and other “advanced” languages

# Unsigned Multiplication in C

## Standard Multiplication Function

- Ignores high order  $w$  bits

## Implements Modular Arithmetic

$$\text{UMult}_w(u, v) = u \cdot v \bmod 2^w$$

# Unsigned vs. Signed Multiplication

## Unsigned Multiplication

```
unsigned ux = (unsigned) x;
```

```
unsigned uy = (unsigned) y;
```

```
unsigned up = ux * uy
```

- Truncates product to  $w$ -bit number  $up = \text{UMult}_w(ux, uy)$
- Simply modular arithmetic

$$up = ux \cdot uy \bmod 2^w$$

## Two's Complement Multiplication

```
int x, y;
```

```
int p = x * y;
```

- Compute exact product of two  $w$ -bit numbers  $x, y$
- Truncate result to  $w$ -bit number  $p = \text{TMult}_w(x, y)$

## Relation

- Signed multiplication gives same bit-level result as unsigned
- `up == (unsigned) p`

# Multiplication Examples

```
short int x = 15213;
int      txx = ((int) x) * x;
int      xx  = (int) (x * x);
int      xx2 = (int) (2 * x * x);
```

```
x      =      15213:      00111011 01101101
txx    = 231435369: 00001101 11001011 01101100 01101001
xx     =      27753: 00000000 00000000 01101100 01101001
xx2    =     -10030: 11111111 11111111 11011000 11010010
```

## Observations

- **Casting order important**
  - If either operand `int`, will perform `int` multiplication
  - If both operands `short int`, will perform `short int` multiplication
- **Really is modular arithmetic**
  - Computes for `xx`:  $15213^2 \bmod 65536 = 27753$
  - Computes for `xx2`:  $(\text{int}) 55506 \text{U} = -10030$
- **Note that `xx2 == (xx << 1)`**

# Power-of-2 Multiply with Shift

## Operation

- $u \ll k$  gives  $u * 2^k$
- Both signed and unsigned

## Examples

- $u \ll 3 \quad == \quad u * 8$
- $u \ll 5 - u \ll 3 \quad == \quad u * 24$
- **Most machines shift and add much faster than multiply**
  - Compiler will generate this code automatically

# Unsigned Power-of-2 Divide with Shift

## Quotient of Unsigned by Power of 2

- $u \gg k$  gives  $\lfloor u / 2^k \rfloor$
- Uses logical shift

	Division	Computed	Hex	Binary
x	15213	15213	3B 6D	00111011 01101101
x >> 1	7606.5	7606	1D B6	00011101 10110110
x >> 4	950.8125	950	03 B6	00000011 10110110
x >> 8	59.4257813	59	00 3B	00000000 00111011

# 2's Comp Power-of-2 Divide with Shift

## Quotient of Signed by Power of 2

- $u \gg k$  gives  $\lfloor u / 2^k \rfloor$
- Uses arithmetic shift
- Rounds wrong direction when  $u < 0$

	Division	Computed	Hex	Binary
$y$	-15213	-15213	C4 93	11000100 10010011
$y \gg 1$	-7606.5	-7607	E2 49	<b>1</b> 1100010 01001001
$y \gg 4$	-950.8125	-951	FC 49	<b>1111</b> 1100 01001001
$y \gg 8$	-59.4257813	-60	FF C4	<b>11111111</b> 11000100

# Correct Power-of-2 Divide

## Quotient of Negative Number by Power of 2

- Want  $\lceil u / 2^k \rceil$  (Round Toward 0)
- Compute as  $\lfloor (u+2^k-1) / 2^k \rfloor$ 
  - In C:  $(u + (1 \ll k) - 1) \gg k$
  - Biases dividend toward 0

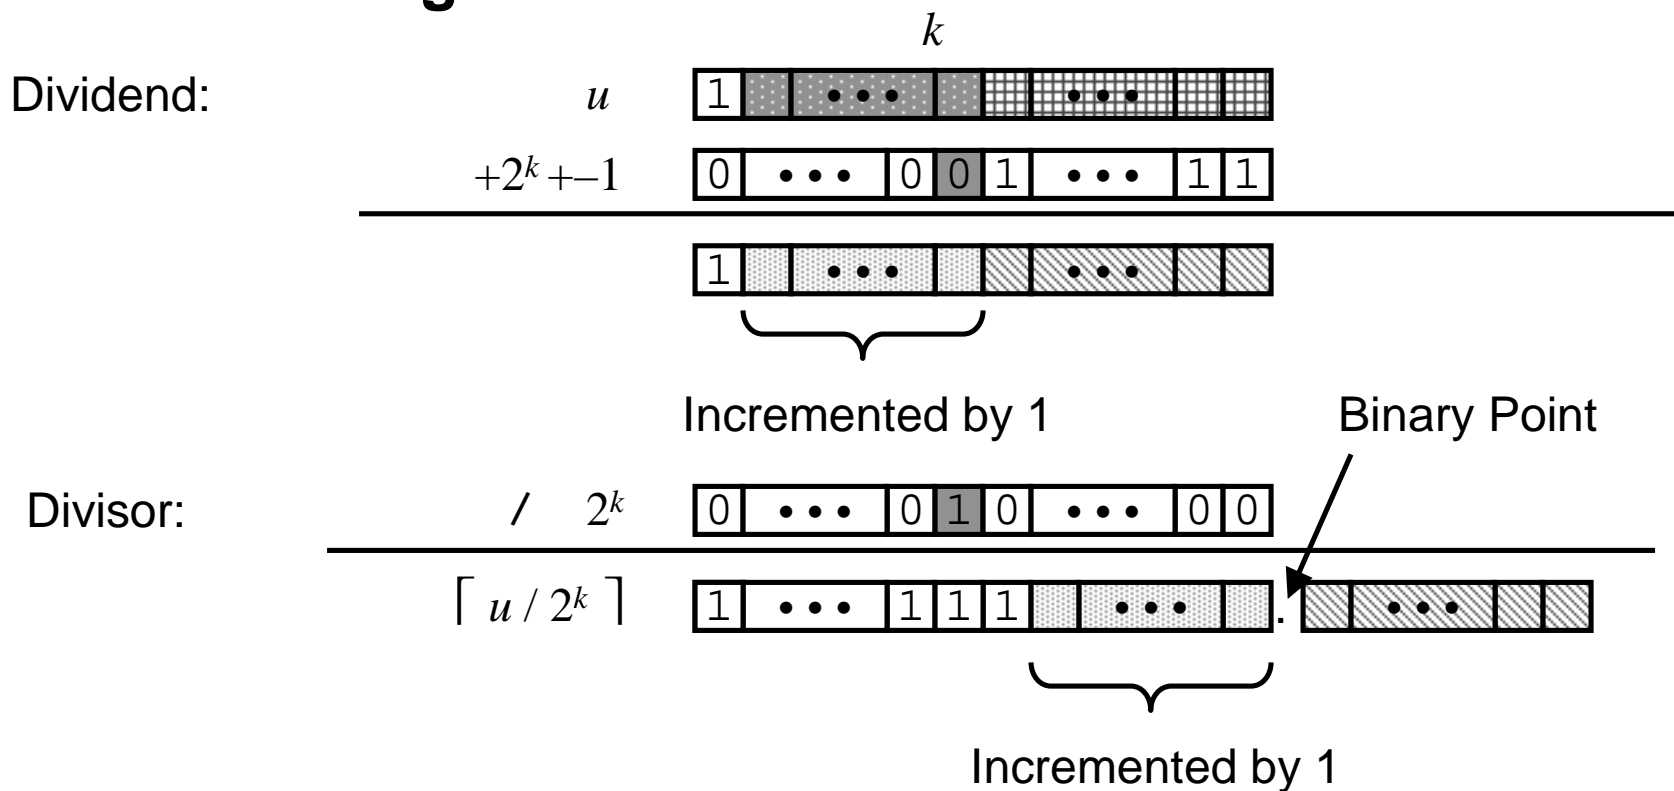

### Case 1: No rounding

Biasing has no effect

# Correct Power-of-2 Divide (Cont.)

## Case 2: Rounding

Biasing adds 1 to final result

# Correct Power-of-2 Divide Examples

	$y/2^k$	Computed	Hex	Binary
$y$	-15213	-15213	C4 93	11000100 10010011
$y+1$		-15212	C4 94	11000100 10010100
$(y+1) \gg 1$	-7606.5	-7606	E2 4A	<b>11100010</b> 01001010
$y$	-15213	-15213	C4 93	11000100 10010011
$y+15$		-15197	C4 A2	11000100 10100010
$(y+15) \gg 4$	-950.8125	-950	FC 4A	<b>11111100</b> 01001010
$y$	-15213	-15213	C4 93	11000100 10010011
$y+255$		-14958	C5 92	11000101 10010010
$(y+255) \gg 8$	-59.4257813	-59	FF C5	<b>11111111</b> 11000101

# Properties of Unsigned Arithmetic

## Unsigned Multiplication with Addition Forms Commutative Ring

- **Addition is commutative group**
- **Closed under multiplication**  
 $0 \leq \text{UMult}_w(u, v) \leq 2^w - 1$
- **Multiplication Commutative**  
 $\text{UMult}_w(u, v) = \text{UMult}_w(v, u)$
- **Multiplication is Associative**  
 $\text{UMult}_w(t, \text{UMult}_w(u, v)) = \text{UMult}_w(\text{UMult}_w(t, u), v)$
- **1 is multiplicative identity**  
 $\text{UMult}_w(u, 1) = u$
- **Multiplication distributes over addition**  
 $\text{UMult}_w(t, \text{UAdd}_w(u, v)) = \text{UAdd}_w(\text{UMult}_w(t, u), \text{UMult}_w(t, v))$

# Properties of Two's Comp. Arithmetic

## Isomorphic Algebras

- **Unsigned multiplication and addition**
  - Truncating to  $w$  bits
- **Two's complement multiplication and addition**
  - Truncating to  $w$  bits

## Both Form Rings

- Isomorphic to ring of integers mod  $2^w$

## Comparison to Integer Arithmetic

- Both are rings
- Integers obey ordering properties, e.g.,

$$u > 0 \quad \Rightarrow \quad u + v > v$$

$$u > 0, v > 0 \quad \Rightarrow \quad u \cdot v > 0$$

- These properties are not obeyed by two's complement arithmetic

$$TMax + 1 \quad == \quad TMin$$

$$15213 * 30426 == -10030 \quad (16\text{-bit words})$$

# C Puzzle Answers

- Assume machine with 32 bit word size, two's complement integers
- *TMin* makes a good counterexample in many cases

- $x < 0 \Rightarrow ((x*2) < 0)$  **False:** *TMin*
- $ux \geq 0$  **True:**  $0 = UMin$
- $x \& 7 == 7 \Rightarrow (x \ll 30) < 0$  **True:**  $x_1 = 1$
- $ux > -1$  **False:**  $0$
- $x > y \Rightarrow -x < -y$  **False:**  $-1, TMin$
- $x * x \geq 0$  **False:**  $65535$   
 $(x*x = -131071)$
- $x > 0 \ \&\& \ y > 0 \Rightarrow x + y > 0$  **False:** *TMax, TMax*
- $x \geq 0 \Rightarrow -x \leq 0$  **True:**  $-TMax < 0$
- $x \leq 0 \Rightarrow -x \geq 0$  **False:** *TMin*
