

Machine-Level Programming IV: x86-64 Procedures, Data

15-213/18-243, Spring 2011
8th Lecture, Feb. 7th

Instructors:

Anthony Rowe, Seth Goldstein and Gregory Kesden

Last Time

■ Procedures (IA32)

- call / return
- %esp, %ebp
- local variables
- recursive functions

2

Today

- Procedures (x86-64)
- Arrays
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- Structures
 - Allocation
 - Access

3

x86-64 Integer Registers

%rax	%eax	%r8	%r8d
%rbx	%ebx	%r9	%r9d
%rcx	%ecx	%r10	%r10d
%rdx	%edx	%r11	%r11d
%rsi	%esi	%r12	%r12d
%rdi	%edi	%r13	%r13d
%rsp	%esp	%r14	%r14d
%rbp	%ebp	%r15	%r15d

- Twice the number of registers
- Accessible as 8, 16, 32, 64 bits

4

x86-64 Integer Registers: Usage Conventions

%rax	Return value	%r8	Argument #5
%rbx	Callee saved	%r9	Argument #6
%rcx	Argument #4	%r10	Caller saved
%rdx	Argument #3	%r11	Caller Saved
%rsi	Argument #2	%r12	Callee saved
%rdi	Argument #1	%r13	Callee saved
%rsp	Stack pointer	%r14	Callee saved
%rbp	Callee saved	%r15	Callee saved

x86-64 Registers

- **Arguments passed to functions via registers**
 - If more than 6 integral parameters, then pass rest on stack
 - These registers can be used as caller-saved as well
- **All references to stack frame via stack pointer**
 - Eliminates need to update **%ebp/%rbp**
- **Other Registers**
 - 6 callee saved
 - 2 caller saved
 - 1 return value (also usable as caller saved)
 - 1 special (stack pointer)

x86-64 Long Swap

```
void swap_l(long *xp, long *yp)
{
    long t0 = *xp;
    long t1 = *yp;
    *xp = t1;
    *yp = t0;
}

swap:
    movq    (%rdi), %rdx
    movq    (%rsi), %rax
    movq    %rax, (%rdi)
    movq    %rdx, (%rsi)
    ret
```

- **Operands passed in registers**
 - First (**xp**) in **%rdi**, second (**yp**) in **%rsi**
 - 64-bit pointers
- **No stack operations required (except `ret`)**
- **Avoiding stack**
 - Can hold all local information in registers

x86-64 Locals in the *Red Zone*

```
/* Swap, using local array */
void swap_a(long *xp, long *yp)
{
    volatile long loc[2];
    loc[0] = *xp;
    loc[1] = *yp;
    *xp = loc[1];
    *yp = loc[0];
}
```

```
swap_a:
    movq    (%rdi), %rax
    movq    %rax, -24(%rsp)
    movq    (%rsi), %rax
    movq    %rax, -16(%rsp)
    movq    -16(%rsp), %rax
    movq    %rax, (%rdi)
    movq    -24(%rsp), %rax
    movq    %rax, (%rsi)
    ret
```

- **Avoiding Stack Pointer Change**
 - Can hold all information within small window beyond stack pointer

x86-64 NonLeaf without Stack Frame

```
/* Swap a[i] & a[i+1] */
void swap_ele(long a[], int i)
{
    swap(&a[i], &a[i+1]);
}
```

- No values held while swap being invoked
- No callee save registers needed
- `rep` instruction inserted as no-op
 - Based on recommendation from AMD

```
swap_ele:
    movslq %rsi,%rax      # Sign extend i
    leaq 8(%rdi,%rsi,8), %rax # &a[i+1]
    leaq (%rdi,%rsi,8), %rdi # &a[i] (1st arg)
    movq %rax,%rsi        # (2nd arg)
    call swap
    rep                    # No-op
    ret
```

9

x86-64 Stack Frame Example

```
long sum = 0;
/* Swap a[i] & a[i+1] */
void swap_ele_su
(long a[], int i)
{
    swap(&a[i], &a[i+1]);
    sum += (a[i]*a[i+1]);
}
```

- Keeps values of `&a[i]` and `&a[i+1]` in callee save registers
- Must set up stack frame to save these registers

```
swap_ele_su:
    movq %rbx, -16(%rsp)
    movq %rbp, -8(%rsp)
    subq $16, %rsp
    movslq %esi,%rax
    leaq 8(%rdi,%rax,8), %rbx
    leaq (%rdi,%rax,8), %rbp
    movq %rbx,%rsi
    movq %rbp,%rdi
    call swap
    movq (%rbx), %rax
    imulq (%rbp), %rax
    addq %rax, sum(%rip)
    movq (%rsp), %rbx
    movq 8(%rsp), %rbp
    addq $16, %rsp
    ret
```

10

Understanding x86-64 Stack Frame

```
swap_ele_su:
    movq %rbx, -16(%rsp)    # Save %rbx
    movq %rbp, -8(%rsp)     # Save %rbp
    subq $16, %rsp          # Allocate stack frame
    movslq %esi,%rax        # Extend i
    leaq 8(%rdi,%rax,8), %rbx # &a[i+1] (callee save)
    leaq (%rdi,%rax,8), %rbp  # &a[i] (callee save)
    movq %rbx,%rsi          # 2nd argument
    movq %rbp,%rdi          # 1st argument
    call swap
    movq (%rbx), %rax        # Get a[i+1]
    imulq (%rbp), %rax       # Multiply by a[i]
    addq %rax, sum(%rip)     # Add to sum
    movq (%rsp), %rbx        # Restore %rbx
    movq 8(%rsp), %rbp       # Restore %rbp
    addq $16, %rsp           # Deallocate frame
    ret
```

11

Understanding x86-64 Stack Frame

```
movq %rbx, -16(%rsp)    # Save %rbx
movq %rbp, -8(%rsp)     # Save %rbp

subq $16, %rsp          # Allocate stack frame

...

movq (%rsp), %rbx        # Restore %rbx
movq 8(%rsp), %rbp       # Restore %rbp

addq $16, %rsp           # Deallocate frame
```

12

Interesting Features of Stack Frame

- **Allocate entire frame at once**
 - All stack accesses can be relative to `%rsp`
 - Do by decrementing stack pointer
 - Can delay allocation, since safe to temporarily use red zone
- **Simple deallocation**
 - Increment stack pointer
 - No base/frame pointer needed

13

x86-64 Procedure Summary

- **Heavy use of registers**
 - Parameter passing
 - More temporaries since more registers
- **Minimal use of stack**
 - Sometimes none
 - Allocate/deallocate entire block
- **Many tricky optimizations**
 - What kind of stack frame to use
 - Various allocation techniques

14

Today

- **Procedures (x86-64)**
- **Arrays**
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- **Structures**

15

Basic Data Types

- **Integral**
 - Stored & operated on in general (integer) registers
 - Signed vs. unsigned depends on instructions used

Intel	ASM	Bytes	C
byte	<code>b</code>	1	<code>[unsigned] char</code>
word	<code>w</code>	2	<code>[unsigned] short</code>
double word	<code>d</code>	4	<code>[unsigned] int</code>
quad word	<code>q</code>	8	<code>[unsigned] long int (x86-64)</code>
- **Floating Point**
 - Stored & operated on in floating point registers

Intel	ASM	Bytes	C
Single	<code>s</code>	4	<code>float</code>
Double	<code>d</code>	8	<code>double</code>
Extended	<code>t</code>	10/12/16	<code>long double</code>

16

Array Allocation

Basic Principle

$T\ A[L];$

- Array of data type T and length L
- Contiguously allocated region of $L * \text{sizeof}(T)$ bytes

17

Array Access

Basic Principle

$T\ A[L];$

- Array of data type T and length L
- Identifier A can be used as a pointer to array element 0: Type T^*

Reference	Type	Value
val[4]	int	3
val	int *	x
val+1	int *	x+4
&val[2]	int *	x+8
val[5]	int	??
*(val+1)	int	5
val + i	int *	x+4i

18

Array Example

```
#define ZLEN 5
typedef int zip_dig[ZLEN];

zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```

- Declaration "`zip_dig cmu`" equivalent to "`int cmu[5]`"
- Example arrays were allocated in successive 20 byte blocks
 - Not guaranteed to happen in general

19

Array Accessing Example

```
int get_digit
(zip_dig z, int dig)
{
    return z[dig];
}
```

IA32

```
# %edx = z
# %eax = dig
movl (%edx,%eax,4),%eax # z[dig]
```

- Register `%edx` contains starting address of array
- Register `%eax` contains array index
- Desired digit at $4 * \text{eax} + \text{edx}$
- Use memory reference $(\text{edx}, \text{eax}, 4)$

20

Array Loop Example (IA32)

```
void zincr(zip_dig z) {
    int i;
    for (i = 0; i < ZLEN; i++)
        z[i]++;
}
```

```
# edx = z
movl $0, %eax      # %eax = i
.L4:               # loop:
    addl $1, (%edx,%eax,4) # z[i]++
    addl $1, %eax        # i++
    cmpl $5, %eax        # i:5
    jne .L4              # if !=, goto loop
```

21

Pointer Loop Example (IA32)

```
void zincr_p(zip_dig z) {
    int *zend = z+ZLEN;
    do {
        (*z)++;
        z++;
    } while (z != zend);
}
```

```
void zincr_v(zip_dig z) {
    void *vz = z;
    int i = 0;
    do {
        (*(int *) (vz+i))++;
        i += ISIZE;
    } while (i != ISIZE*ZLEN);
}
```

```
# edx = z = vz
movl $0, %eax      # i = 0
.L8:               # loop:
    addl $1, (%edx,%eax) # Increment vz+i
    addl $4, %eax        # i += 4
    cmpl $20, %eax       # Compare i:20
    jne .L8            # if !=, goto loop
```

22

Nested Array Example

```
#define PCOUNT 4
zip_dig pgh[PCOUNT] =
    {{1, 5, 2, 0, 6},
     {1, 5, 2, 1, 3},
     {1, 5, 2, 1, 7},
     {1, 5, 2, 2, 1}};
```

- “zip_dig pgh[4]” equivalent to “int pgh[4][5]”
 - Variable `pgh`: array of 4 elements, allocated contiguously
 - Each element is an array of 5 `int`'s, allocated contiguously
- “Row-Major” ordering of all elements guaranteed

23

Multidimensional (Nested) Arrays

Declaration

- `T A[R][C];`
- 2D array of data type `T`
- `R` rows, `C` columns
- Type `T` element requires `K` bytes

```
A[0][0] . . . A[0][C-1]
.
.
.
A[R-1][0] . . . A[R-1][C-1]
```

Array Size

- `R * C * K` bytes

Arrangement

- Row-Major Ordering

```
int A[R][C];
```

24

Nested Array Row Access

Row Vectors

- $A[i]$ is array of C elements
- Each element of type T requires K bytes
- Starting address $A + i * (C * K)$

```
int A[R][C];
```

25

Nested Array Row Access Code

```
int *get_pgh_zip(int index)
{
    return pgh[index];
}
```

```
#define PCOUNT 4
zip_dig pgh[PCOUNT] =
{
    {1, 5, 2, 0, 6},
    {1, 5, 2, 1, 3},
    {1, 5, 2, 1, 7},
    {1, 5, 2, 2, 1}};
```

```
# %eax = index
leal (%eax,%eax,4),%eax # 5 * index
leal pgh(,%eax,4),%eax # pgh + (20 * index)
```

Row Vector

- $pgh[index]$ is array of 5 int's
- Starting address $pgh + 20 * index$

IA32 Code

- Computes and returns address
- Compute as $pgh + 4 * (index + 4 * index)$

26

Nested Array Row Access

Array Elements

- $A[i][j]$ is element of type T , which requires K bytes
- Address $A + i * (C * K) + j * K = A + (i * C + j) * K$

```
int A[R][C];
```

27

Nested Array Element Access Code

```
int get_pgh_digit
(int index, int dig)
{
    return pgh[index][dig];
}
```

```
movl 8(%ebp), %eax # index
leal (%eax,%eax,4), %eax # 5*index
addl 12(%ebp), %eax # 5*index+dig
movl pgh(,%eax,4), %eax # offset 4*(5*index+dig)
```

Array Elements

- $pgh[index][dig]$ is int
- Address: $pgh + 20 * index + 4 * dig$
 - $= pgh + 4 * (5 * index + dig)$

IA32 Code

- Computes address $pgh + 4 * ((index + 4 * index) + dig)$

28

Multi-Level Array Example

```
zip_dig cmu = { 1, 5, 2, 1, 3 };
zip_dig mit = { 0, 2, 1, 3, 9 };
zip_dig ucb = { 9, 4, 7, 2, 0 };
```

```
#define UCOUNT 3
int *univ[UCOUNT] = {mit, cmu, ucb};
```

- Variable `univ` denotes array of 3 elements
- Each element is a pointer
 - 4 bytes
- Each pointer points to array of int's

29

Element Access in Multi-Level Array

```
int get_univ_digit
(int index, int dig)
{
    return univ[index][dig];
}
```

```
movl 8(%ebp), %eax      # index
movl univ(,%eax,4), %edx # p = univ[index]
movl 12(%ebp), %eax     # dig
movl (%edx,%eax,4), %eax # p[dig]
```

Computation (IA32)

- Element access `Mem[Mem[univ+4*index]+4*dig]`
- Must do two memory reads
 - First get pointer to row array
 - Then access element within array

30

Array Element Accesses

Nested array

```
int get_pgh_digit
(int index, int dig)
{
    return pgh[index][dig];
}
```

Multi-level array

```
int get_univ_digit
(int index, int dig)
{
    return univ[index][dig];
}
```

Accesses look similar in C, but addresses very different:

`Mem[pgh+20*index+4*dig]`

`Mem[Mem[univ+4*index]+4*dig]`

31

N X N Matrix Code

Fixed dimensions

- Know value of N at compile time

```
#define N 16
typedef int fix_matrix[N][N];
/* Get element a[i][j] */
int fix_ele
(fix_matrix a, int i, int j)
{
    return a[i][j];
}
```

Variable dimensions, explicit indexing

- Traditional way to implement dynamic arrays

```
#define IDX(n, i, j) ((i)*(n)+(j))
/* Get element a[i][j] */
int vec_ele
(int n, int *a, int i, int j)
{
    return a[IDX(n,i,j)];
}
```

Variable dimensions, implicit indexing

- Now supported by gcc

```
/* Get element a[i][j] */
int var_ele
(int n, int a[n][n], int i, int j)
{
    return a[i][j];
}
```

32

16 X 16 Matrix Access

■ Array Elements

- Address $A + i * (C * K) + j * K$
- $C = 16, K = 4$

```
/* Get element a[i][j] */
int fix_ele(fix_matrix a, int i, int j) {
    return a[i][j];
}
```

```
movl 12(%ebp), %edx    # i
sall $6, %edx          # i*64
movl 16(%ebp), %eax    # j
sall $2, %eax          # j*4
addl 8(%ebp), %eax     # a + j*4
movl (%eax,%edx), %eax # *(a + j*4 + i*64)
```

33

n X n Matrix Access

■ Array Elements

- Address $A + i * (C * K) + j * K$
- $C = n, K = 4$

```
/* Get element a[i][j] */
int var_ele(int n, int a[n][n], int i, int j) {
    return a[i][j];
}
```

```
movl 8(%ebp), %eax    # n
sall $2, %eax         # n*4
movl %eax, %edx       # n*4
imull 16(%ebp), %edx  # i*n*4
movl 20(%ebp), %eax   # j
sall $2, %eax         # j*4
addl 12(%ebp), %eax   # a + j*4
movl (%eax,%edx), %eax # *(a + j*4 + i*n*4)
```

34

Optimizing Fixed Array Access

```
#define N 16
typedef int fix_matrix[N][N];
```

```
/* Retrieve column j from array */
void fix_column
(fix_matrix a, int j, int *dest)
{
    int i;
    for (i = 0; i < N; i++)
        dest[i] = a[i][j];
}
```

■ Computation

- Step through all elements in column j

■ Optimization

- Retrieving successive elements from single column

35

Optimizing Fixed Array Access

■ Optimization

- Compute $ajp = \&a[i][j]$
 - Initially $= a + 4*j$
 - Increment by $4*N$

Register	Value
%ecx	ajp
%ebx	dest
%edx	i

```
/* Retrieve column j from array */
void fix_column
(fix_matrix a, int j, int *dest)
{
    int i;
    for (i = 0; i < N; i++)
        dest[i] = a[i][j];
}
```

```
.L8:
    movl (%ecx), %eax    # Read *ajp
    movl %eax, (%ebx,%edx,4) # Save in dest[i]
    addl $1, %edx       # i++
    addl $64, %ecx      # ajp += 4*N
    cmpl $16, %edx      # i:N
    jne .L8             # if !=, goto loop
```

36

Optimizing Variable Array Access

- Compute $ajp = \&a[i][j]$
 - Initially $= a + 4*j$
 - Increment by $4*n$

Register	Value
%ecx	ajp
%edi	dest
%edx	i
%ebx	4*n
%esi	n

```
/* Retrieve column j from array */
void var_column
(int n, int a[n][n],
 int j, int *dest)
{
    int i;
    for (i = 0; i < n; i++)
        dest[i] = a[i][j];
}
```

```
.L18:                # loop:
    movl (%ecx), %eax # Read *ajp
    movl %eax, (%edi,%edx,4) # Save in dest[i]
    addl $1, %edx      # i++
    addl $ebx, %ecx    # ajp += 4*n
    cmpl $edx, %esi    # n:i
    jg .L18           # if >, goto loop
```

37

Today

- Procedures (x86-64)
- Arrays
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- Structures
 - Allocation
 - Access

38

Structure Allocation

```
struct rec {
    int a[3];
    int i;
    struct rec *n;
};
```

Memory Layout

Concept

- Contiguously-allocated region of memory
- Refer to members within structure by names
- Members may be of different types

39

Structure Access

```
struct rec {
    int a[3];
    int i;
    struct rec *n;
};
```

Accessing Structure Member

- Pointer indicates first byte of structure
- Access elements with offsets

```
void
set_i(struct rec *r,
      int val)
{
    r->i = val;
}
```

IA32 Assembly

```
# %edx = val
# %eax = r
movl %edx, 12(%eax) # Mem[r+12] = val
```

40

Generating Pointer to Structure Member

```
struct rec {
    int a[3];
    int i;
    struct rec *n;
};
```

Generating Pointer to Array Element

- Offset of each structure member determined at compile time
- Arguments
 - Mem[%ebp+8]: r
 - Mem[%ebp+12]: idx

```
int *get_ap
(struct rec *r, int idx)
{
    return &r->a[idx];
}
```

```
movl 12(%ebp), %eax # Get idx
sall $2, %eax      # idx*4
addl 8(%ebp), %eax  # r+idx*4
```

41

Following Linked List

C Code

```
void set_val
(struct rec *r, int val)
{
    while (r) {
        int i = r->i;
        r->a[i] = val;
        r = r->n;
    }
}
```

```
struct rec {
    int a[3];
    int i;
    struct rec *n;
};
```

Element i

Register	Value
%edx	r
%ecx	val

```
.L17: # loop:
movl 12(%edx), %eax # r->i
movl %ecx, (%edx,%eax,4) # r->a[i] = val
movl 16(%edx), %edx # r = r->n
testl %edx, %edx # Test r
jne .L17 # If != 0 goto loop
```

42

Summary

- Procedures in x86-64**
 - Stack frame is relative to stack pointer
 - Parameters passed in registers
- Arrays**
 - One-dimensional
 - Multi-dimensional (nested)
 - Multi-level
- Structures**
 - Allocation
 - Access

43
